

Building Leaders for Advancing Science and Technology (BLAST) (Full)

Internet of Things Hands-on Activities with Arduino

Dr. Murat Kuzlu
Department of Engineering Technology

Outline

- Internet
 - Internet of Things (IoT)
 - Arduino
 - ThingSpeak
 - Hands-on Activities

<https://medium.com/@otavioguastamacchia/creating-a-simple-iot-case-8102f22908a7>

What is the Internet?

<https://www.connexusuk.com/high-speed-internet/>

- The Internet is a global **web of computers connected to each by communication lines** (mostly phone lines).

- If you look at a map of big cities, smaller towns, and scattered houses, each is connected together with roads, railways, etc. This is similar to the Internet, except with the Internet, wires connect computers.

The Internet is a superhighway.

<http://mediatechnologyeducation.pbworks.com/w/page/20693030/The%20Information%20Superhighway>

Some ways to use the Internet

- Surfing
- E-mail
- Social media
- Shopping
- News
- Games
- **REMOTE MONITORING and CONTROL**

Why Internet is Important

- Data, data, data!
- Modern organizations rely on the efficient transmission of data
- Enables distributed systems, **real-time communication**, electronic commerce, social media, and the Web

<https://makeawebsitehub.com/social-media-sites/>

Data vs. Information

Data are the facts or details from which information is derived

Trends – WoT and IoT

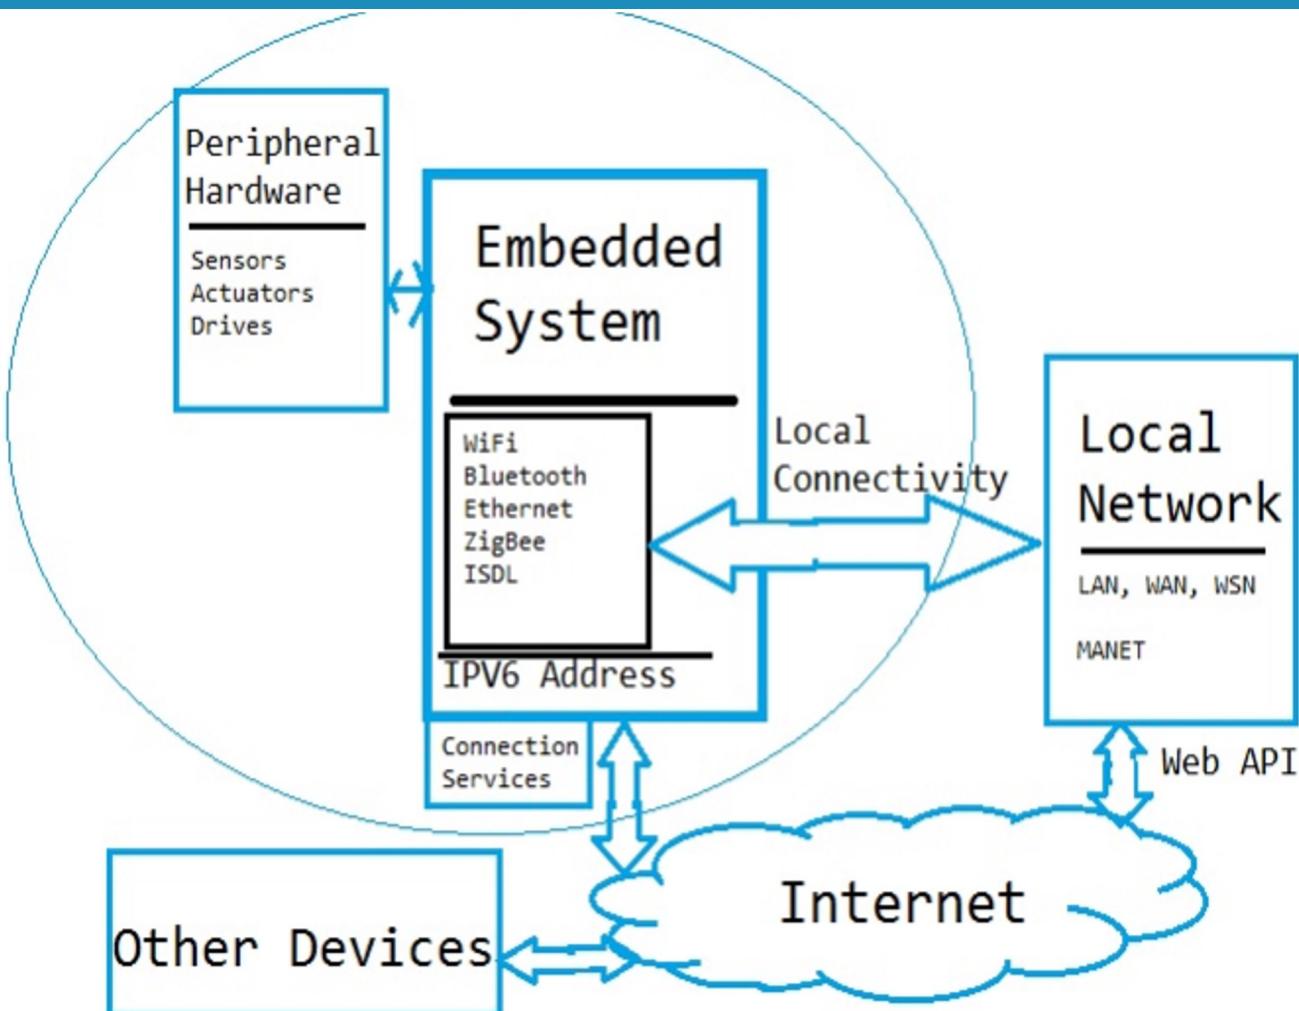

- The Web of Things
 - Everything connects to the network!
 - e.g., cars, refrigerators, thermostats, shoes, doors, etc.
 - Networks need to support the increased demands of these devices
- The Internet of Thing (IoT)
 - *The network of physical objects*—devices, vehicles, buildings and other items-- *embedded with electronics, software, sensors, and network connectivity*—that enables these objects *to collect and exchange data.* ”

The Internet of Thing (IoT)

IoT

- *Network of physical objects*
- *Embedded System*
- *Network connectivity*
- *Collect and exchange data*

IoT Examples

Examples of objects that can fall into the scope of Internet of Things include connected security systems, sensors, thermostats, cars, electronic appliances, light in the household and commercial environments, alarm clocks, speaker systems, vending machines and more.

<https://www.expressvpn.com/blog/what-is-the-internet-of-things-iot/>

Internet-connected devices

John Romkey's Toaster (1990, Ethernet)

Ambient Orb (2002, via pager network)

iPod (2001), iTunes Store (2003, via USB/PC)

Nike+ iPod (2006), Bracelet (2008 via USB/PC)

Rafi Haladjian's Nabaztag (2006, Wifi)

Rob Faludi's Botanicalls (2006, Ethernet)

Schulze&Webb Availabot (2006, via USB/PC)

iPhone (2007, GSM)

Amazon Kindle (2007, 3G)

Wafaa Bilal's Shoot an Iraqi (2007, ?)

Withings BodyScale (2008, Wifi)

Vitality GlowCap (2008, Wifi; 2011, 3G)

BakerTweet (2009, 3G)

Adrian McEwen's Bubblino (2009, Ethernet)

David Bowen's Telepresent Water (2011, ?)

Nest Thermostat (2011, Wifi)

BERG's Little Printer (2011, ?)

Supermechanical's Twine (2012, Wifi)

Olly & Polly (2012, via USB/PC)

Koubachi Sensor (2012, Wifi)

Descriptive Camera (2012, Ethernet)

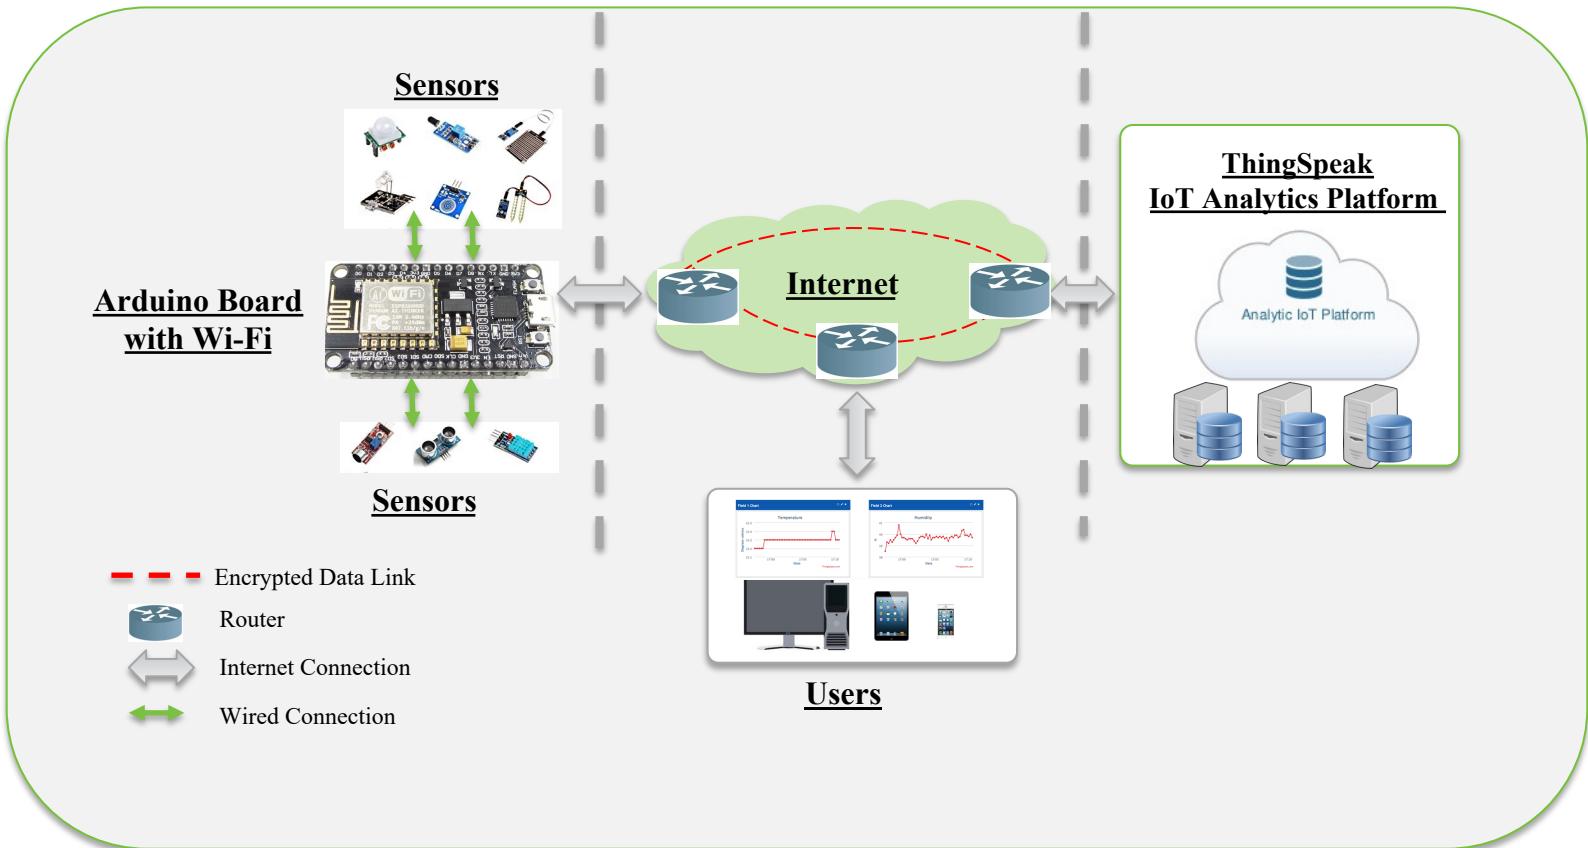

.....

The Future of IoT

As far as the reach of the IoT, there are more than 12 billion devices that can currently connect to the Internet, and it is expected that by 2020 there will be 26 times more connected things than people.

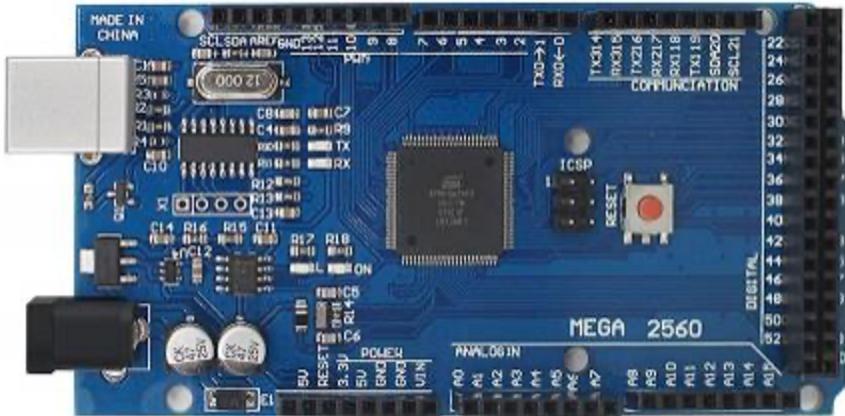

Architecture of an IoT-based System

Why Arduino ?

- It is an **open-source project**, software/hardware is extremely **accessible** and very flexible to be customized and extended
- It is **flexible**, offers a variety of digital and analog inputs, *SPI* and serial interface and digital and *PWM* outputs
- It is **easy to use**, connects to computer via USB and communicates using standard serial protocol, runs in standalone mode and as interface connected to PC/Macintosh computers
- It is **inexpensive**, and comes with free authoring software
- Arduino is backed up by a growing **online community**, lots of source code is already available and we can share and post our examples for others to use, too.

Arduino

Installing IDE

- The Arduino Integrated Development Environment

ARDUINO 1.8.0

The open-source Arduino Software (IDE) makes it easy to write code and upload it to the board. It runs on Windows, Mac OS X, and Linux. The environment is written in Java and based on Processing and other open-source software.

This software can be used with any Arduino board. Refer to the [Getting Started](#) page for installation instructions.

Windows Installer
Windows ZIP file for non admin install

Windows app

Mac OS X 10.7 Lion or newer

Linux 32 bits
Linux 64 bits
Linux ARM

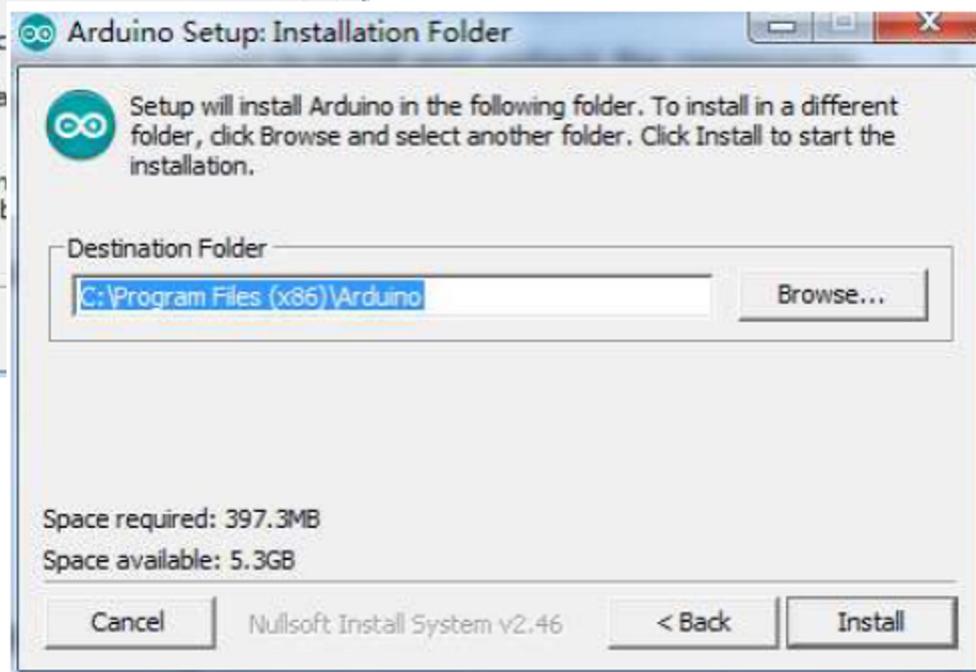

[Release Notes](#)
[Source Code](#)
[Checksums \(sha512\)](#)

The version available at this website is usually the latest version, and the actual version may be newer than the version in the picture.

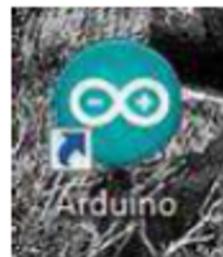

Installing Arduino (Windows)

Click Agree and Install...

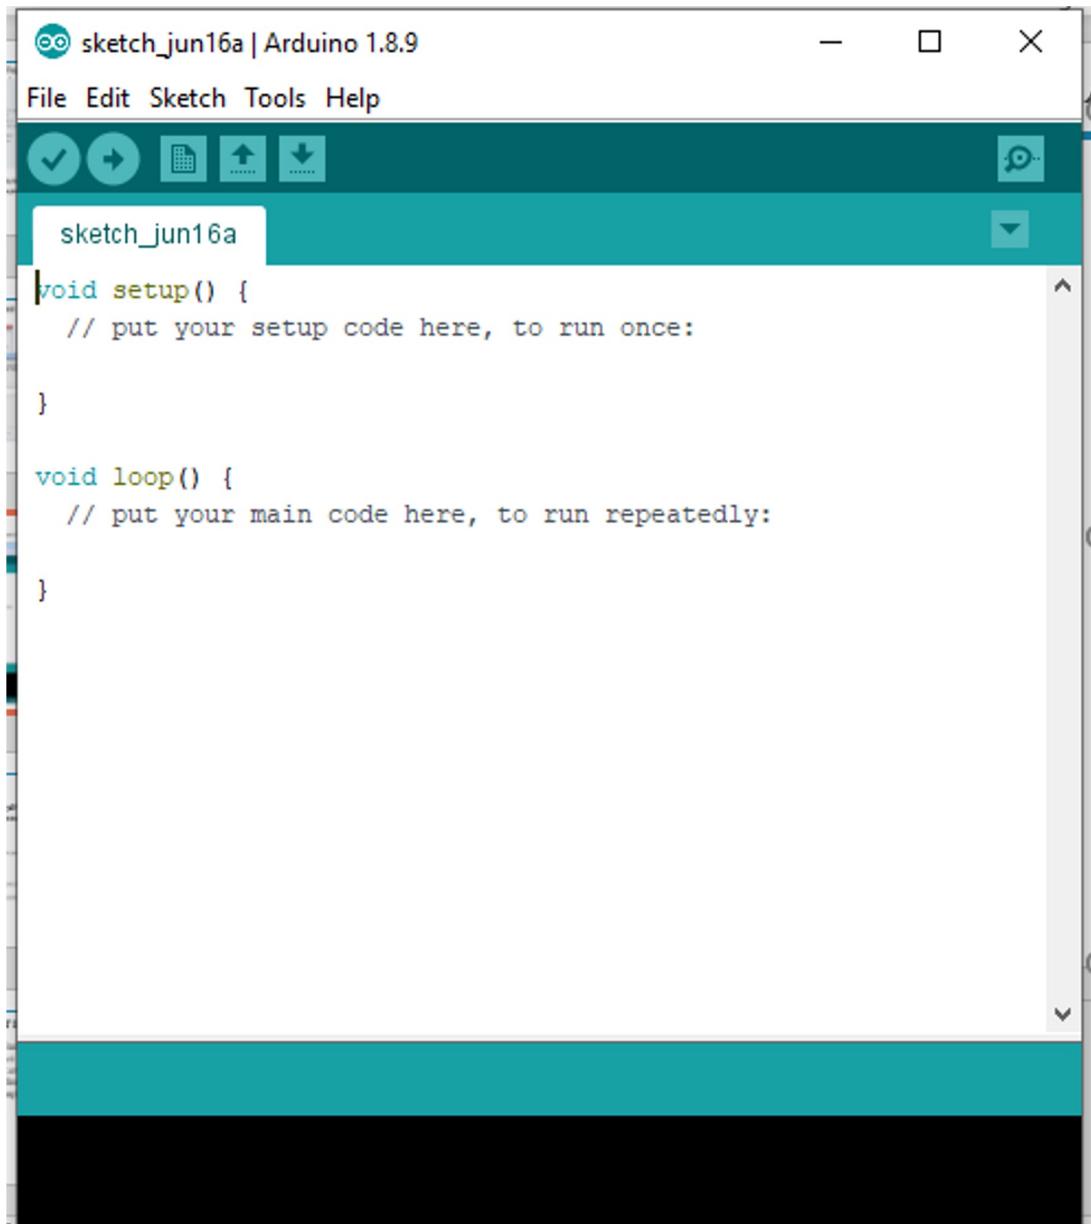

The following Icon appears on the desktop

Arduino IDE

Double-click to enter the
desired development
environment

Add Libraries and Open Serial Monitor

What are Libraries?

Libraries are a collection of code that makes it easy for you to connect to a sensor, display, module, etc. For example, the built-in LiquidCrystal library makes it easy to talk to character LCD displays. There are hundreds of additional libraries available on the Internet for download. The built-in libraries and some of these additional libraries are listed in the reference. To use the additional libraries, you will need to install them.

Arduino Serial Monitor (Windows, Mac, Linux)

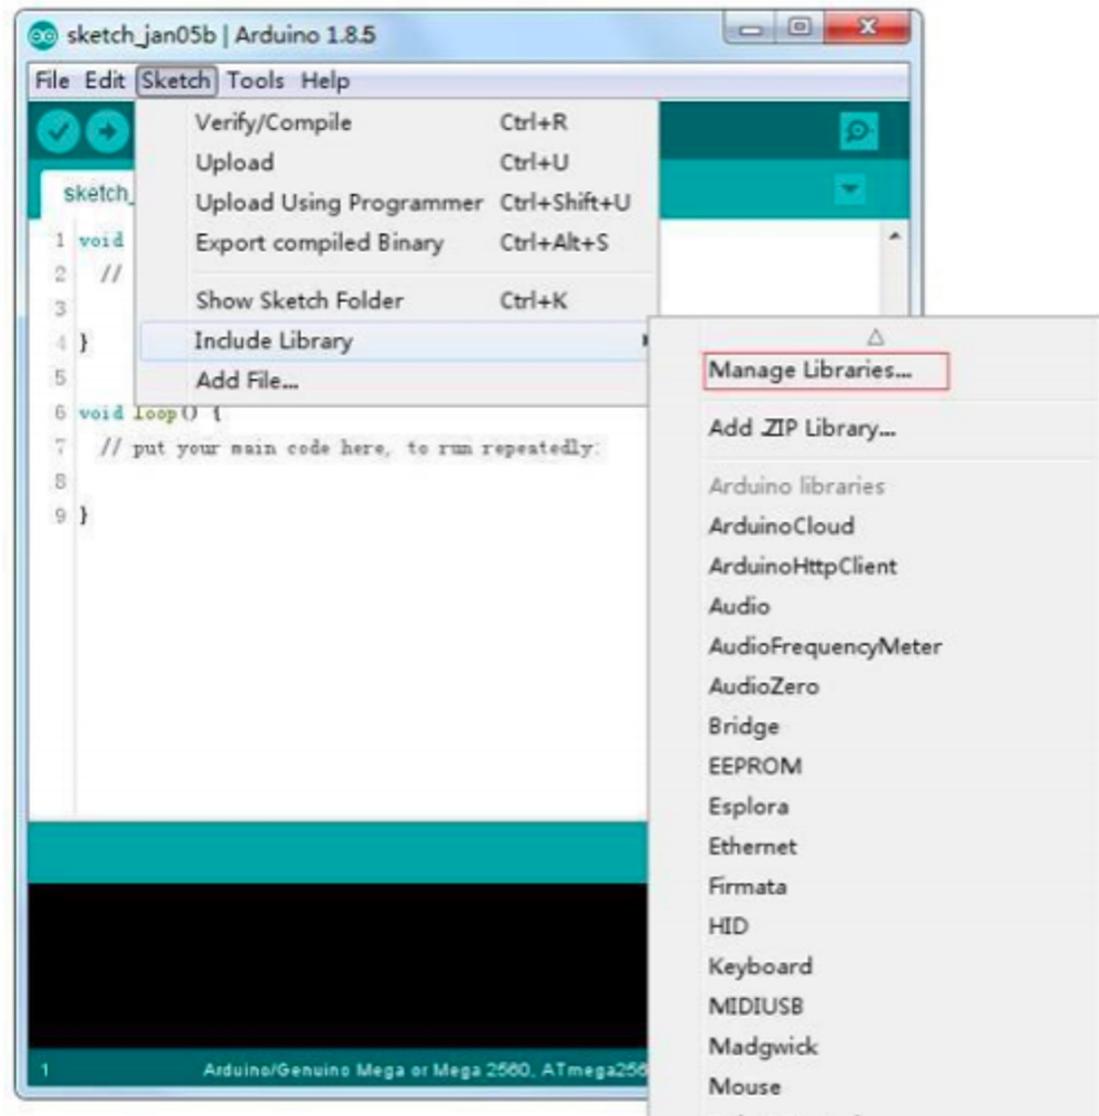

The Arduino Integrated Development Environment (IDE) is the software side of the Arduino platform. And, because using a terminal is such a big part of working with Arduinos and other microcontrollers, they decided to include a serial terminal with the software. Within the Arduino environment, this is called the Serial Monitor.

Add Libraries and Open Serial Monitor

How to Install a Library?

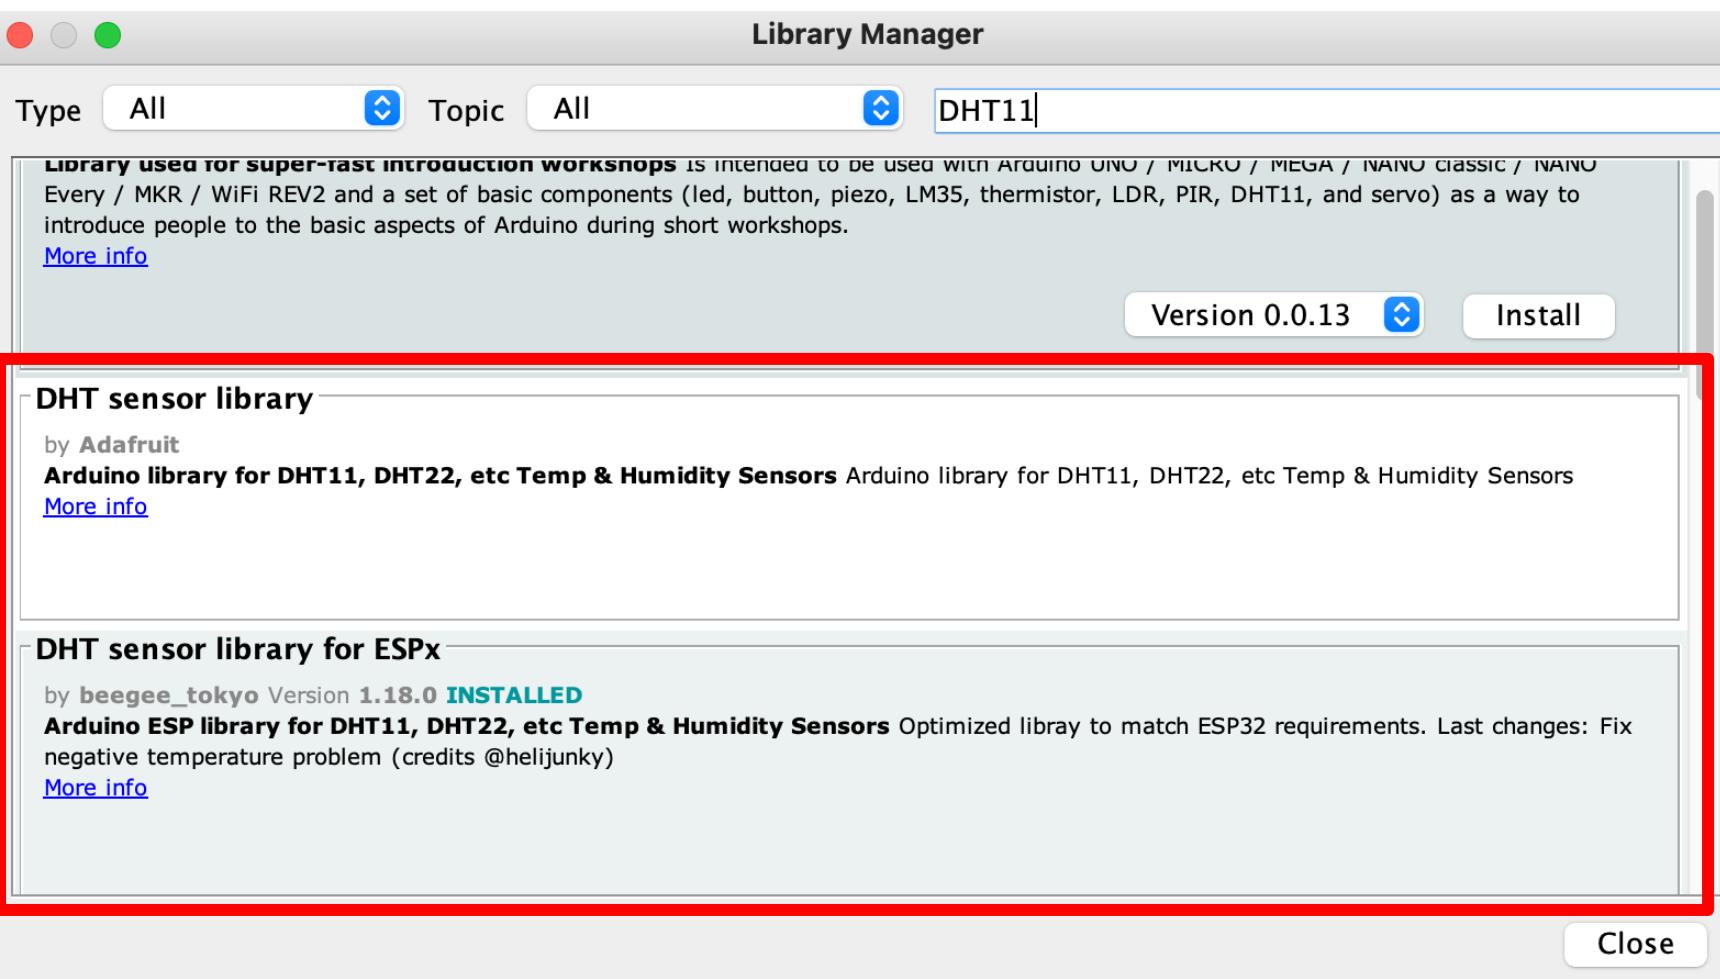

Using the Library Manager
To install a new library into your Arduino IDE you can use the Library Manager (available from IDE version 1.8.0).

Open the IDE and click to the "Sketch" menu and then Include Library > Manage Libraries.

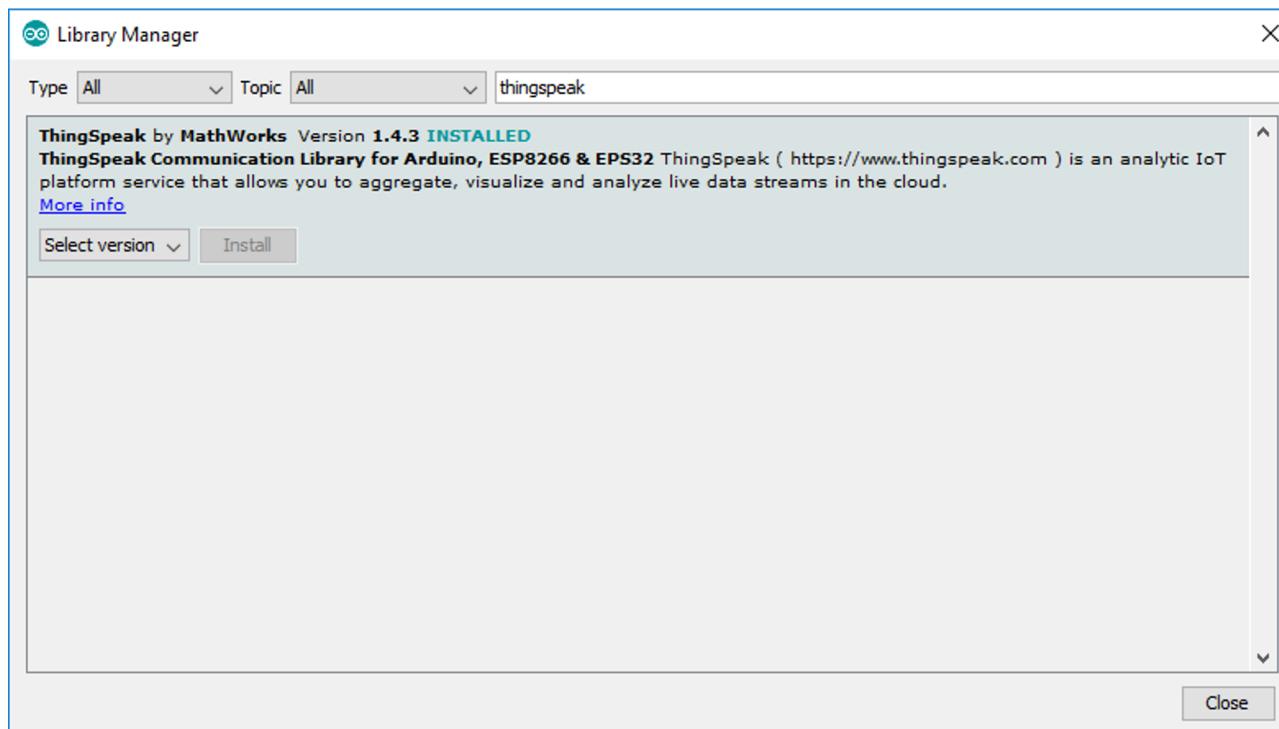

Add Libraries- DHT11

Open the IDE and click to the "Sketch" menu and then Include Library > Manage Libraries > Type “DHT11” > Install “DHT sensor library” and “DHT sensor library for ESPx”

Add Libraries- Arduino

- The Arduino IDE needs to have the ThingSpeak library installed in order for your devices to know how to send data to ThingSpeak. In the Arduino IDE, choose Sketch, Include Library, and Manage Libraries. Search for “thingspeak” and click Install.

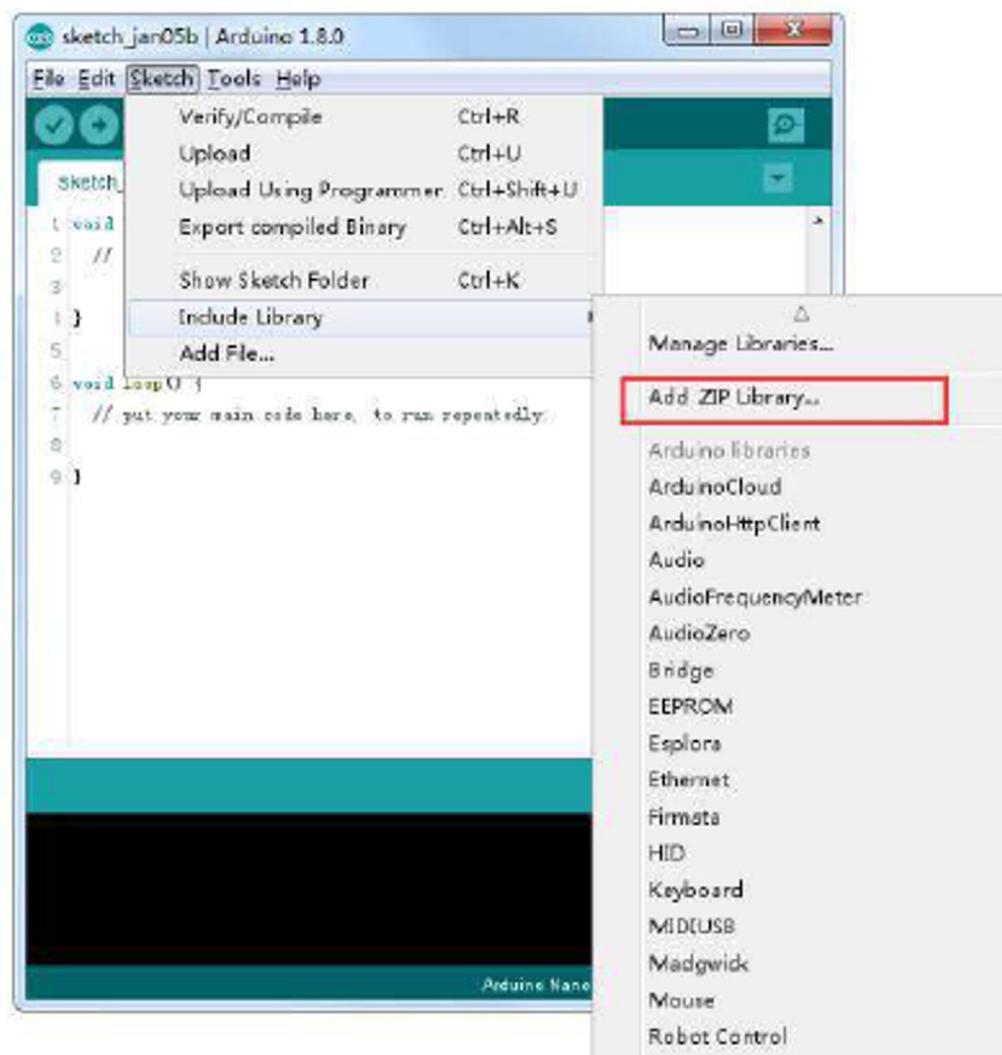

Add Libraries and Open Serial Monitor

How to Install a Library?

Importing a .zip Library.

In the Arduino IDE, navigate to Sketch > Include Library.

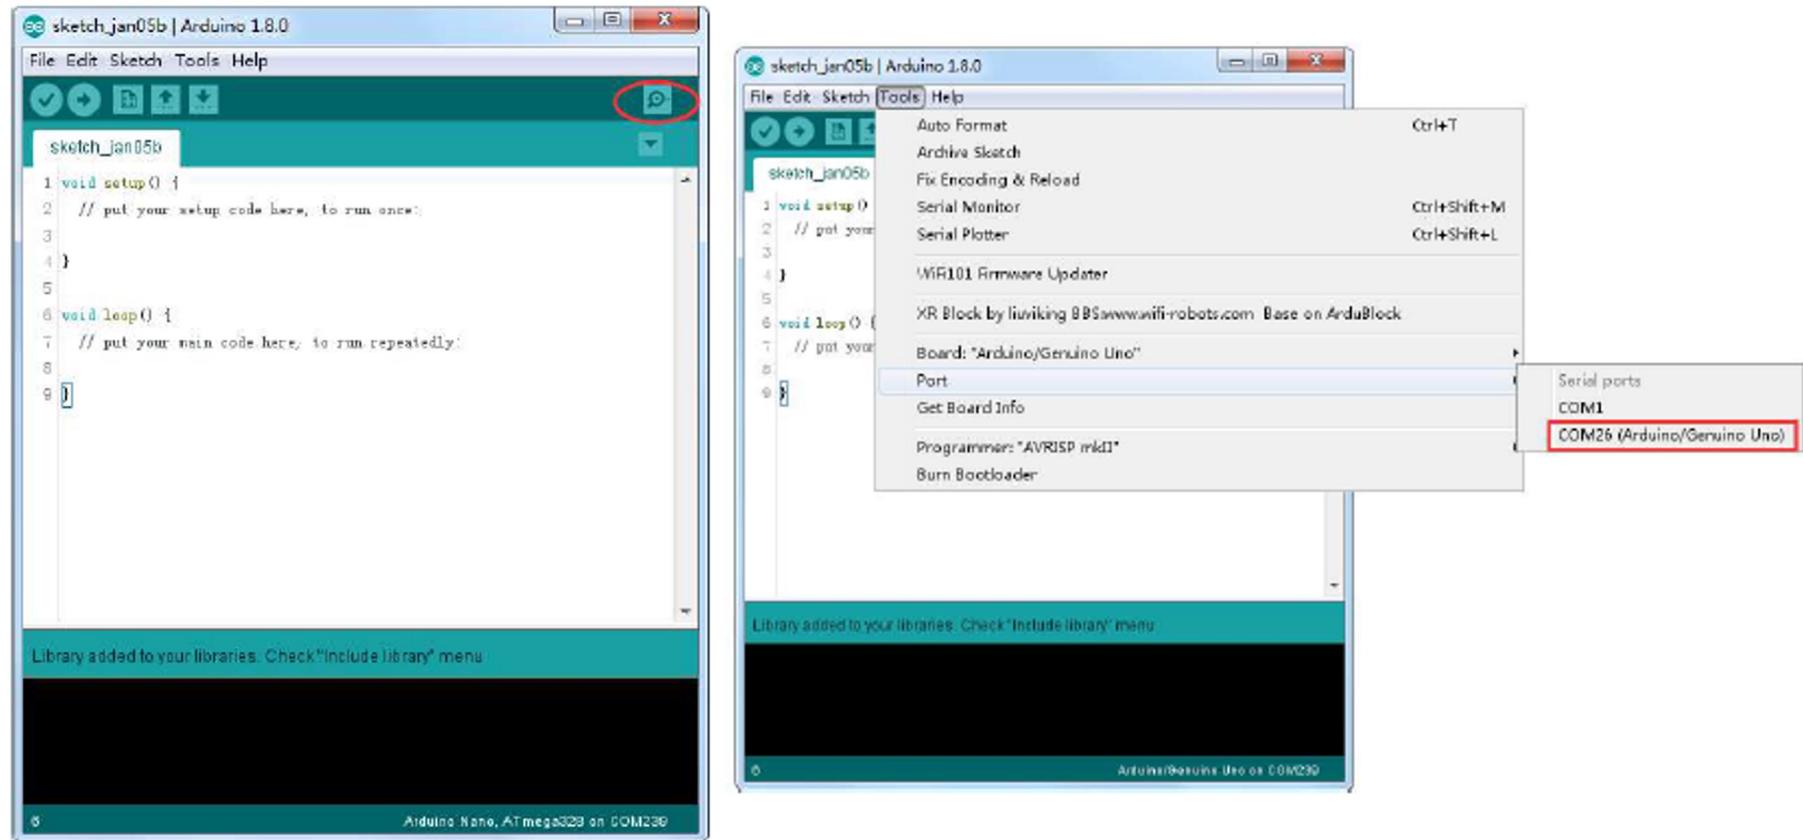

At the top of the drop-down list, select the option to "Add ZIP Library".

Add Libraries and Open Serial Monitor

Arduino Serial Monitor (Windows, Mac, Linux) and Make a Serial Connection

The Arduino Integrated Development Environment (IDE) is the software side of the Arduino platform. And, because using a terminal is such a big part of working with Arduinos and other microcontrollers, they decided to include a serial terminal with the software. Within the Arduino environment, this is called the Serial Monitor.

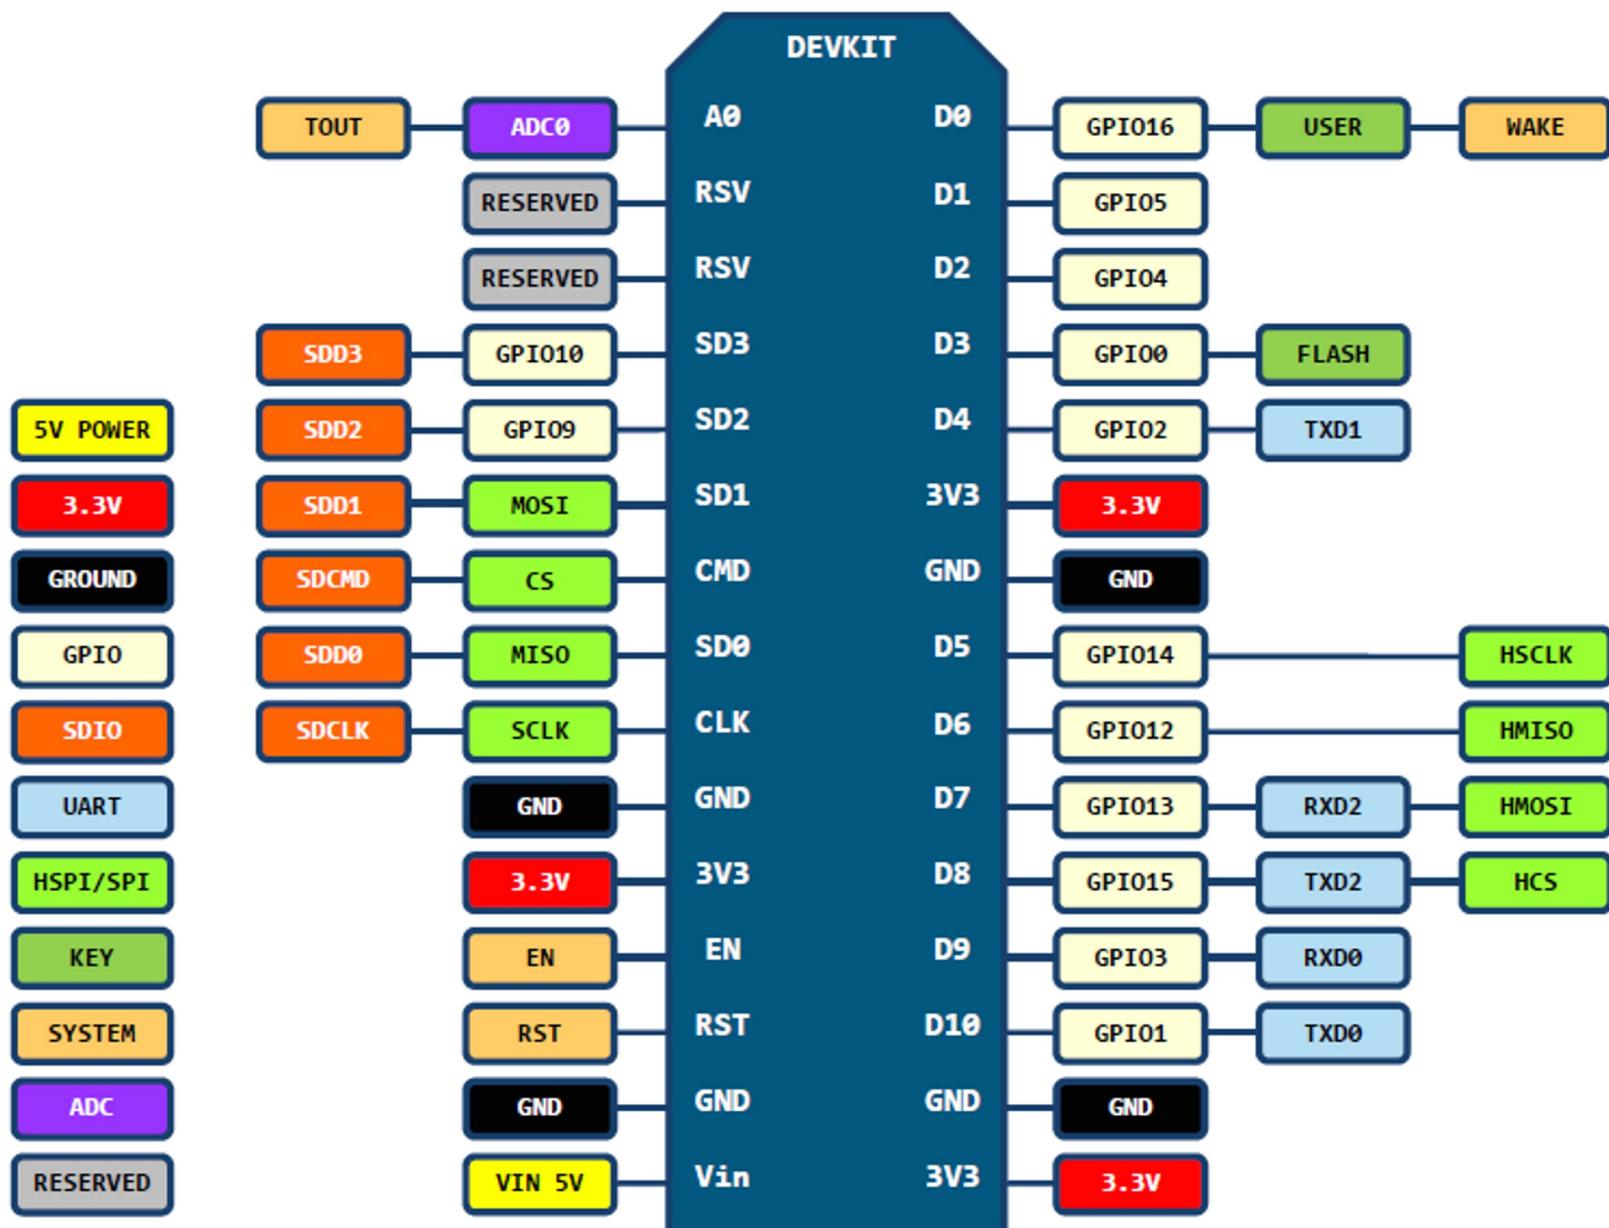

NodeMCU ESP8266 ESP-12E

- Voltage: 3.3V.
- Wi-Fi Direct (P2P), soft-AP.
- Integrated TCP/IP protocol stack.
- GPIOs: 17 (multiplexed with other functions).
- Analog to Digital: 1 input with 1024 step resolution.
- 802.11 support: b/g/n.
- Maximum concurrent TCP connections: 5
- Good tutorial:
https://www.handsontec.com/pdf_learn/esp8266-V10.pdf

NodeMCU ESP8266 ESP-12E Pinout

NodeMCU setup

- *Additional Board Manager URL:*
 - http://arduino.esp8266.com/stable/package_esp8266com_index.json

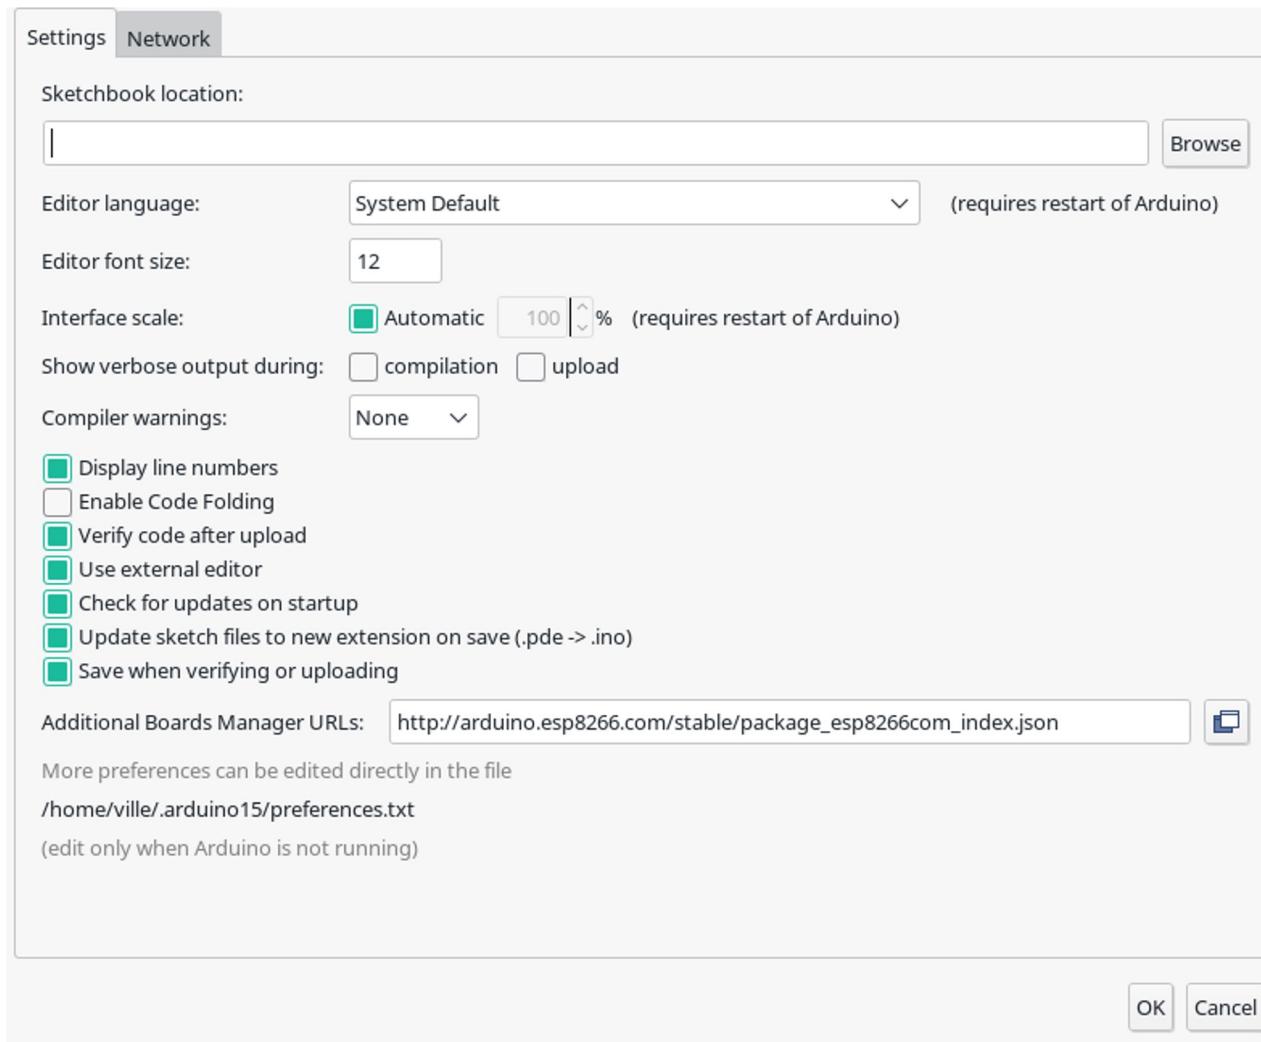

Installing with Boards Manager

Starting with 1.6.4, Arduino allows installation of third-party platform packages using Boards Manager. We have packages available for Windows, Mac OS, and Linux (32 and 64 bit).

- Install Arduino 1.6.8 from the [Arduino website](#).
- Start Arduino and open Preferences window.
- Enter `http://arduino.esp8266.com/stable/package_esp8266com_index.json` into *Additional Board Manager URLs* field.
You can add multiple URLs, separating them with commas.
- Open Boards Manager from Tools > Board menu and install *esp8266* platform (and don't forget to select your ESP8266 board from Tools > Board menu after installation).

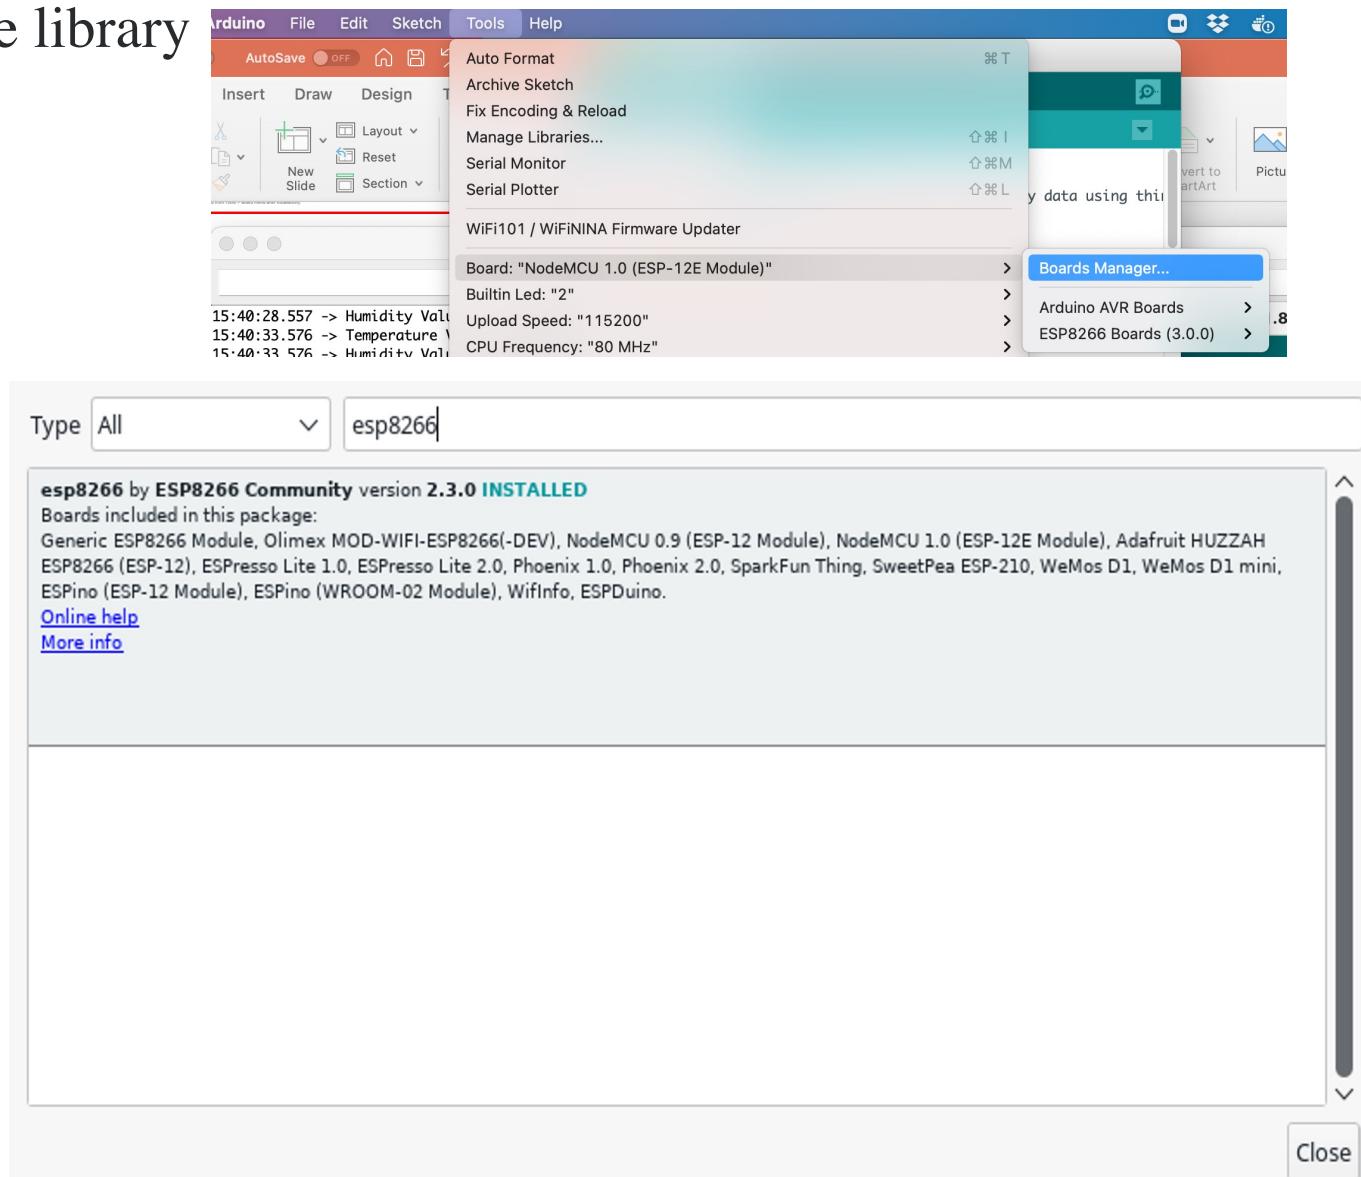

NodeMCU setup

- Add the link to the *Additional Board Manager URLs*

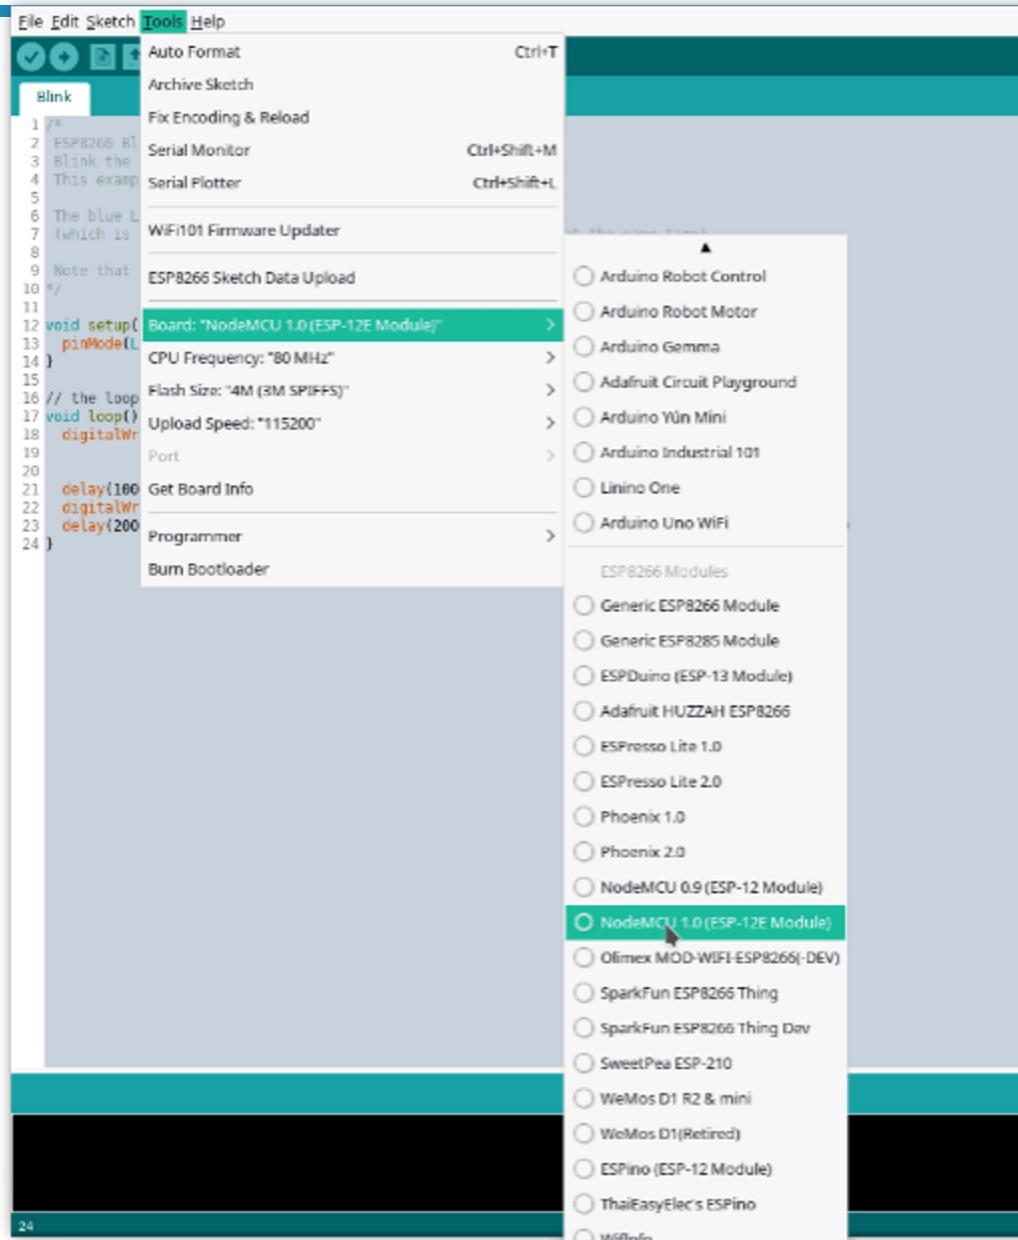

NodeMCU setup

- Search the board manager for *esp8266*
- Install the library

NodeMCU setup

- Select the NodeMCU 2.0 as your board
- Additional settings appear under the board menu
- They can be left as they are
- Higher Upload Speed reduces your upload times

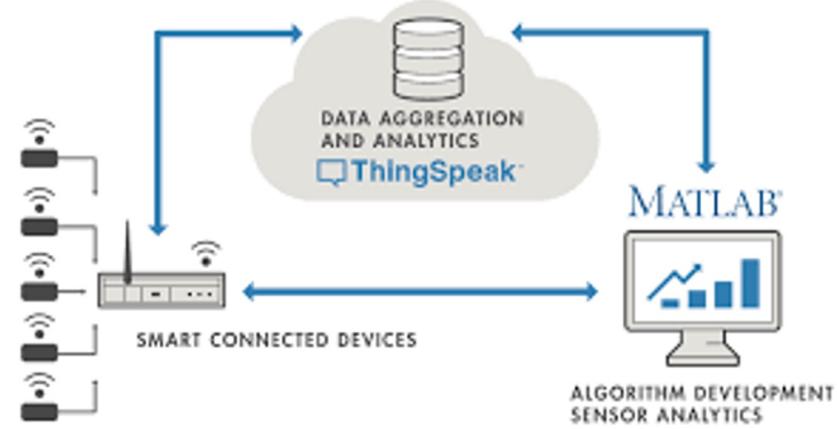

NodeMCU setup

- If the device doesn't appear in the port menu after installing the library and connecting the board you can try installing the USB to Serial chip drivers.
- The chip is the ch340g
- Drivers can be found on the NodeMCU git:
<https://github.com/nodemcu/nodemcu-devkit/tree/master/Drivers>

ThingSpeak

- ThingSpeak is a Web Service (REST API) that lets you collect and store sensor data in the cloud and develop Internet of Things applications.
- It works with Arduino, Raspberry Pi and MATLAB (premade libraries and APIs exists).
- But it should work with all kind of Programming Languages, since it uses a REST API and HTTP.

- <https://thingspeak.com>

What is ThingSpeak?

- **What is ThingSpeak:**
ThingSpeak is an IoT analytics platform service that lets you collect and store sensor data in the cloud and develop Internet of Things applications.
- **ThingSpeak Channel:**
'ThingSpeak Channel' is the core element of the ThingSpeak platform. This channel is used to store the real-time data, or the data transferred through various sensors and embedded systems. Data stored at the channel is further used for analysis and visualization.
- Software Requirement: Internet
- Hardware Requirement: Arduino.

The screenshot shows the ThingSpeak homepage with a dark blue header featuring the logo, navigation links (Channels, Apps, Community, Support), and user options (How to Buy, Account, Sign Out). The main banner has a city skyline background with the text "Understand Your Things" and "The open IoT platform with MATLAB analytics". Below the banner are three main sections: "Collect" (Send sensor data privately to the cloud), "Analyze" (Analyze and visualize your data with MATLAB), and "Act" (Trigger a reaction). At the bottom, there are sections for "ThingSpeak Features" (private/public channels, RESTful MQTT APIs, MATLAB analytics) and "Works With" (Arduino, Particle Photon, Raspberry Pi, etc.).

Creating A Channel

- Before creating a channel, you need to sign into things speak. You can easily sign in either using your either ThingSpeak account or mathswork account, or create a new mathswork account via following link:
- https://thingspeak.com/users/sign_up
- Login Page
- Email: mkuzlu@hotmail.com
- Password: ODU_Blast2000

Create MathWorks Account

Location

▼

First Name

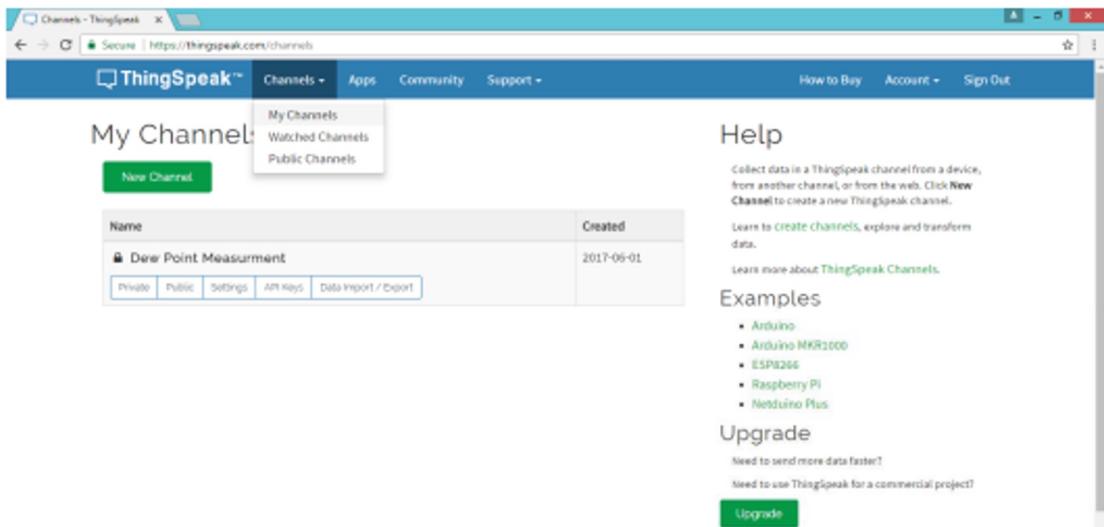

Last Name

The screenshot shows a web browser window titled "Log In - ThingSpeak" with the URL "https://ThingSpeak.com/login". The page has a blue header with the ThingSpeak logo and navigation links for Channels, Apps, Community, and Support. Below the header is a "Log in to ThingSpeak" form. It contains fields for "Email Address" (with the value "someone@example.com") and "Password" (with the value "secret"). There is also a "Forgot your password?" link and a green "Sign In" button. At the bottom of the form, there are links for "New user? Sign up for the first time". The browser taskbar at the bottom shows various icons for Microsoft Office applications like Word, Excel, and PowerPoint, as well as Google Chrome and File Explorer. The system tray on the right shows the date and time as "08-02 07:06 2017".

Creating A Channel

1. Click on the menu bar
Channels> My Channels.

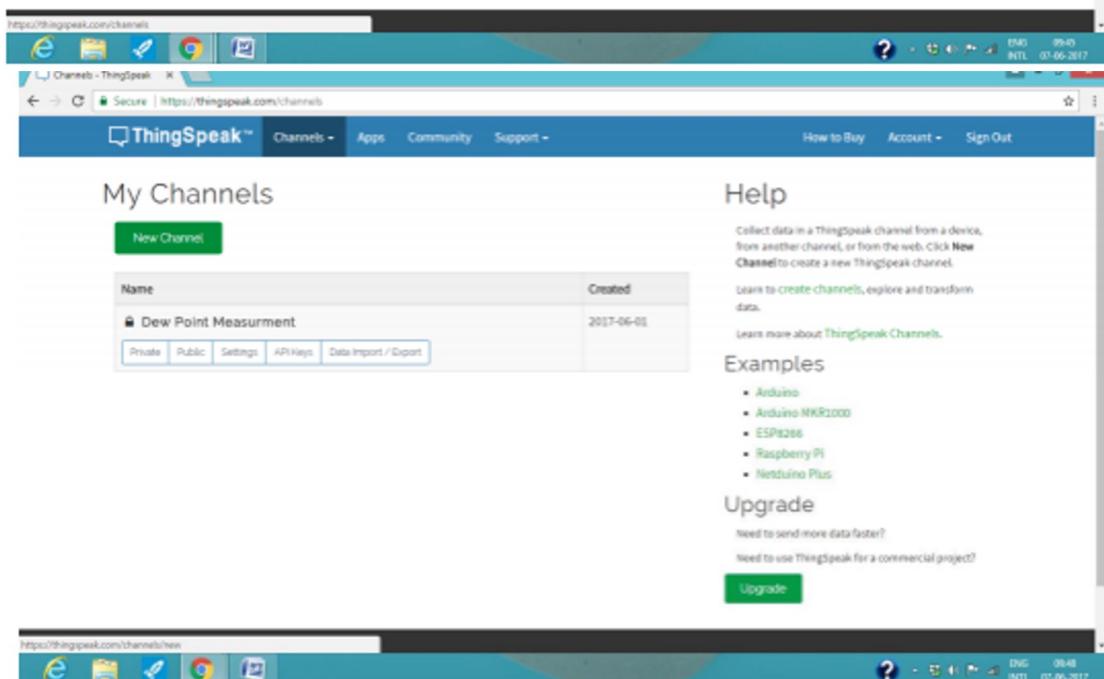

The screenshot shows a web browser window for 'Channels - ThingSpeak'. The address bar shows 'https://thingspeak.com/channels'. The navigation bar includes 'ThingSpeak™', 'Channels', 'Apps', 'Community', 'Support', 'How to Buy', 'Account', and 'Sign Out'. A dropdown menu from the 'Channels' button shows options: 'My Channels' (selected), 'Watched Channels', and 'Public Channels'. The main content area is titled 'My Channel' with a green 'New Channel' button. Below it is a table with one row:

Name	Created
Dew Point Measurement	2017-06-01

Below the table are buttons for 'Private', 'Public', 'Settings', 'API Keys', and 'Data Import / Export'. To the right, there's a 'Help' section with instructions on collecting data, creating channels, and transforming data, along with links to 'ThingSpeak Channels' and examples like Arduino, Raspberry Pi, etc. There's also an 'Upgrade' button.

2. Now on the channels page click on the button 'New Channel.'

This screenshot is identical to the one above, showing the 'My Channels' page with the 'New Channel' button highlighted. The table below is empty, indicating no new channels have been created yet.

Creating A Channel

3. New channel page have various text box fields showing the settings of the channel

- a. **Name** -- provide a unique name to your channel.
- b. **Fields** -- Click the check boxes next to the field and then enter the field name.
- c. To make your channel public check the '**Make Public**' check box
- d. Similarly, you can also add the location to your channel by clicking the '**Show Location**' check box
- e. Check the '**Show video**' check box to make the video visible uploaded by you.
- f. Now click the '**Save channel**' button to save your channel

The screenshots illustrate the process of creating a new channel on ThingSpeak. In the first step, a 'New Channel' form is shown with a 'Name' field set to 'weather calculation'. The 'Description' field is empty. Below it, there are eight 'Field' input boxes, each with a checkmark next to it. The first three fields are labeled 'temperature', 'humidity', and 'dew point'. The subsequent five fields are empty. In the second step, the 'Channel Settings' section is displayed. It includes fields for 'Make Public' (unchecked), 'URL' (empty), 'Elevation' (empty), 'Show Location' (unchecked, with 'Latitude' and 'Longitude' both set to 0.0), 'Show Video' (checked, with 'YouTube' selected), 'Video ID' (empty), and 'Show Status' (unchecked). A large green 'Save Channel' button is located at the bottom of this section.

Creating A Channel

4. Now, the channel page opens with the following tabs:

- a. **Private View**-- It displays the information about your channel that is only visible to you

The screenshot shows a web browser window titled "weather calculation - ThingSpeak". The URL is https://thingspeak.com/channels/283988/private_show. The page has a blue header with the ThingSpeak logo and navigation links: Channels, Apps, Community, Support, How to Buy, Account, and Sign Out. Below the header, there are tabs: Private View (selected), Public View, Channel Settings, API Keys, and Data Import / Export. There are also buttons for Add Visualizations and Data Export. On the right, there are links for MATLAB Analysis and MATLAB Visualization. The main content area is titled "Channel Stats" and shows creation and update times. Below this are two charts labeled "Field 1 Chart" and "Field 2 Chart", both titled "weather calculation". The bottom of the screen shows the Windows taskbar with various icons.

- b. **Public View**- if you have chosen to make your channel publicly visible then it will display the selected fields and information

The screenshot shows a web browser window titled "weather calculation - ThingSpeak". The URL is https://thingspeak.com/channels/283988. The page layout is identical to the Private View version, with the ThingSpeak logo at the top and tabs for Private View, Public View, Channel Settings, API Keys, and Data Import / Export. The "Public View" tab is selected. The main content area shows three charts labeled "Field 1 Chart", "Field 2 Chart", and "Field 3 Chart", all titled "weather calculation". To the right, there is a "Channel Locations" section showing a map of West Africa with Nigeria highlighted. The bottom of the screen shows the Windows taskbar with various icons.

Creating A Channel

c. **Channel Settings-** it will show all the options that are available during the channel creation

The screenshot shows the 'Channel Settings' tab of a ThingSpeak channel. The channel ID is 283988. The name is 'weather calculation'. The description is empty. There are six fields listed: Field 1 (temperature), Field 2 (humidity), Field 3 (dew point), Field 4, Field 5, and Field 6. The help section provides a detailed explanation of each field type and its purpose.

Channel Settings

Percentage complete: 30%

Channel ID: 283988

Name: weather calculation

Description:

Field 1: temperature

Field 2: humidity

Field 3: dew point

Field 4

Field 5

Field 6

Help

Channels store all the data that a ThingSpeak application collects. Each channel includes eight fields that can hold any type of data, plus three fields for location data and one for status data. Once you collect data in a channel, you can use ThingSpeak apps to analyze and visualize it.

Channel Settings

- Channel Name: Enter a unique name for the ThingSpeak channel.
- Description: Enter a description of the ThingSpeak channel.
- Fields: Check the box to enable the field, and enter a field name. Each ThingSpeak channel can have up to 8 fields.
- Metadata: Enter information about channel data, including JSON, XML, or CSV data.
- Tags: Enter keywords that identify the channel; separate tags with commas.
- Latitude: Specify the position of the sensor or thing that collects data in decimal degrees. For example, the latitude of the city of London is 51.5072.
- Longitude: Specify the position of the sensor or thing that collects data in decimal degrees. For example, the longitude of the city of London is -0.1275.
- Elevation: specify the position of the sensor or thing that collects data in meters. For example, the elevation of the city of London is 35.052.
- Make Public: if you want to make the channel publicly available, check this box.
- URL: If you have a website that contains information about your ThingSpeak channel,

d. **API Keys-** in this tab you will have two API Keys -- Read API Key (to read from your channel), write API Key (to write to your channel)

The screenshot shows the 'API Keys' tab of a ThingSpeak channel. It displays two API keys: 'Write API Key' (Key: EHOFXHw6LISM1YL1) and 'Read API Key' (Key: XYUT6QR5CW98QG4J). The 'Help' section explains the purpose of each key. The 'API Keys Settings' section provides instructions for generating new keys. The 'API Requests' section shows examples of API requests for updating a channel feed, getting a channel feed, and getting a channel field.

Write API Key

Key: EHOFXHw6LISM1YL1

Generate New Write API Key

Read API Keys

Key: XYUT6QR5CW98QG4J

Note:

Save Note Delete API Key

Help

API keys enable you to write data to a channel or read data from a private channel. API keys are auto-generated when you create a new channel.

API Keys Settings

- Write API Key: Use this key to write data to a channel. If you feel your key has been compromised, click Generate New Write API Key.
- Read API Key: Use this key to allow other people to view your private channel feeds and data. Click Generate New Read API Key to generate a new read key for the channel.
- Note: Use this field to enter information about channel read keys. For example, add notes to keep track of users with access to your channel.

API Requests

Update a Channel Feed

PUT https://api.thingspeak.com/update?api_key=EHOFXHw6LISM1YL1&field1

Get a Channel Feed

GET https://api.thingspeak.com/channels/283988/feeds.json?api_key=XYUT6QR5CW98QG4J

Get a Channel Field

GET https://api.thingspeak.com/channels/283988/fields/1.json?api_key=XYUT6QR5CW98QG4J

Creating A Channel

- e. **Data import/export-** it enables you to import and export the channel data

The screenshot shows the 'Data Import / Export - Ti' page on ThingSpeak. At the top, there are tabs for 'Private View', 'Public View', 'Channel Settings', 'API Keys', and 'Data Import / Export' (which is currently selected). Below this, the 'Import' section allows users to upload a CSV file to import data into the channel. It includes fields for 'Choose File' (with 'No file chosen'), 'Time Zone' (set to '(GMT+00:00) UTC'), and a green 'Upload' button. To the right, a 'Help' section provides instructions on how to select a CSV file and notes that the CSV file should contain a date field in the first column if your data doesn't contain timestamp info. Below the import section is the 'Export' section, which allows users to download all of this channel's feeds in CSV format, with a green 'Download' button. On the right side of the page, there is a 'API Requests' sidebar with several options: 'Update a Channel Feed' (POST https://api.thingspeak.com/update?api_key=DEPHWBNL25M2YL18&field1=8), 'Get a Channel Feed' (GET https://api.thingspeak.com/channels/283088 Feeds.json?results=2), 'Get a Channel Field' (GET https://api.thingspeak.com/channels/283088/field1/1.json?results=1), and 'Get Channel Status Updates'.

My Channels

- f. In future your channel will be available to you just by clicking '**Channels> My Channels**'

ThingSpeak Library for Arduino

- The Arduino IDE needs to have the ThingSpeak library installed in order for your devices to know how to send data to ThingSpeak. In the Arduino IDE, choose Sketch, Include Library, and Manage Libraries. Search for “thingspeak” and click Install.

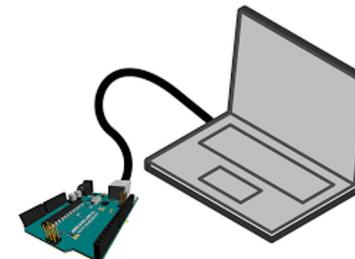

Topics of this workshop

- **Getting started**
(setup and programming of IoT hardware)
- **Reading and Writing**
(physical computing: sensors and actuators)
- **Connecting your device to the Internet**
(IoT: monitoring sensors, controlling actuators)

IoT hardware

Any Internet-connected computer with an **interface to the real world** (sensors, actuators)

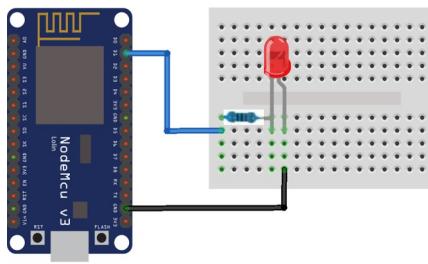

Small => can be **embedded into things**

Small computer = **microcontroller** (or **board**), e.g.,
Arduino, Netduino Plus, BeagleBone, ...

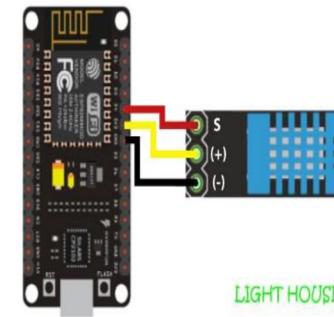

Hands-on Activities

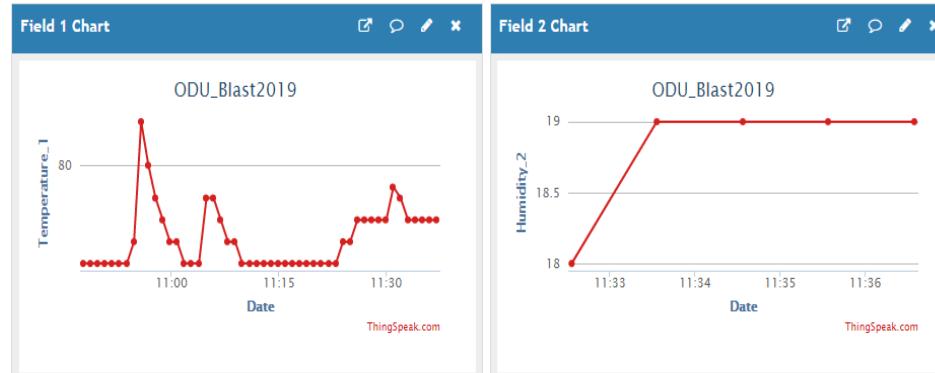

```
#define LED D1 // Led in NodeMCU at pin GPIO5 (D1).
C
void setup()
{
pinMode(LED, OUTPUT); // set the digital pin as output.

}

void loop()
{
digitalWrite(LED, HIGH); // turn the LED off.
delay(1000); // wait for 1 second.
digitalWrite(LED, LOW); // turn the LED on.
delay(1000); // wait for 1 second.
}
```

LIGHT HOUSE

Hands on Activities and Source Code

Copy&Paste or Download examples, from GitHub:

https://github.com/muratkuzlu/ODU_BLAST2021

Focus on **end-to-end results, not details**

Getting started

The **IDE** (Integrated Development Environment) allows you to **program** your board, i.e., “make it do something new”

You **edit** a program on your computer, then **upload** it to your board where it’s stored in the program memory (flash) and **executed** in RAM

Please Note: Once it has been programmed, your board can run on its own, without another computer

Reading and Writing

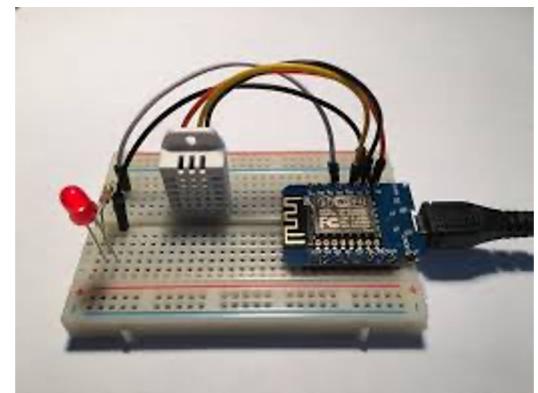

IoT hardware has an **interface to the real world**

GPIO (General Purpose Input/Output) pins

Measure: **read** sensor value from **input** pin

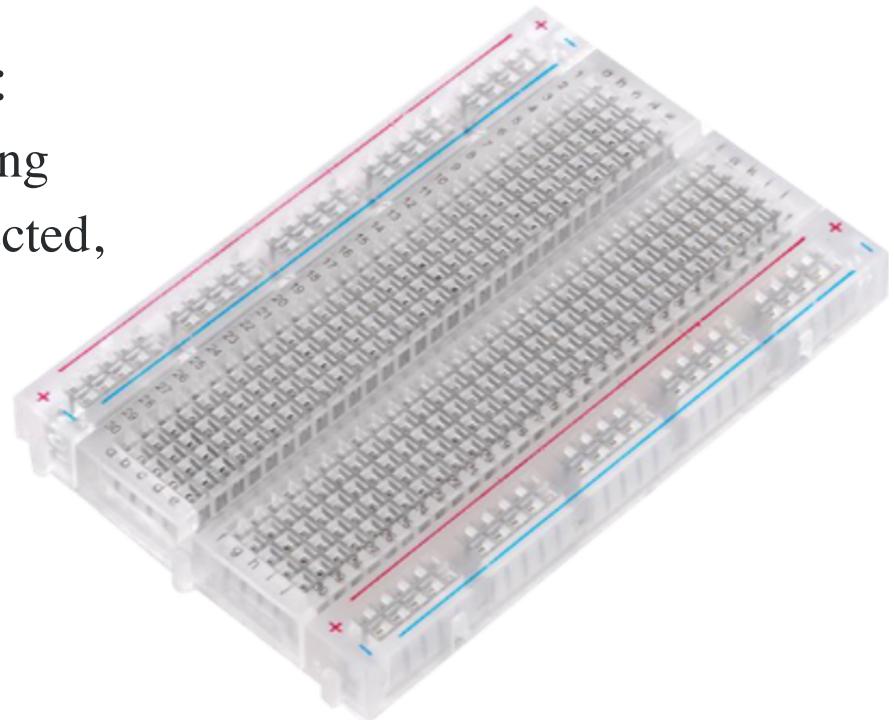

Manipulate: **write** actuator value to **output** pin

Inputs and outputs can be **digital or analog**

Prototyping Circuits Solderless Breadboard

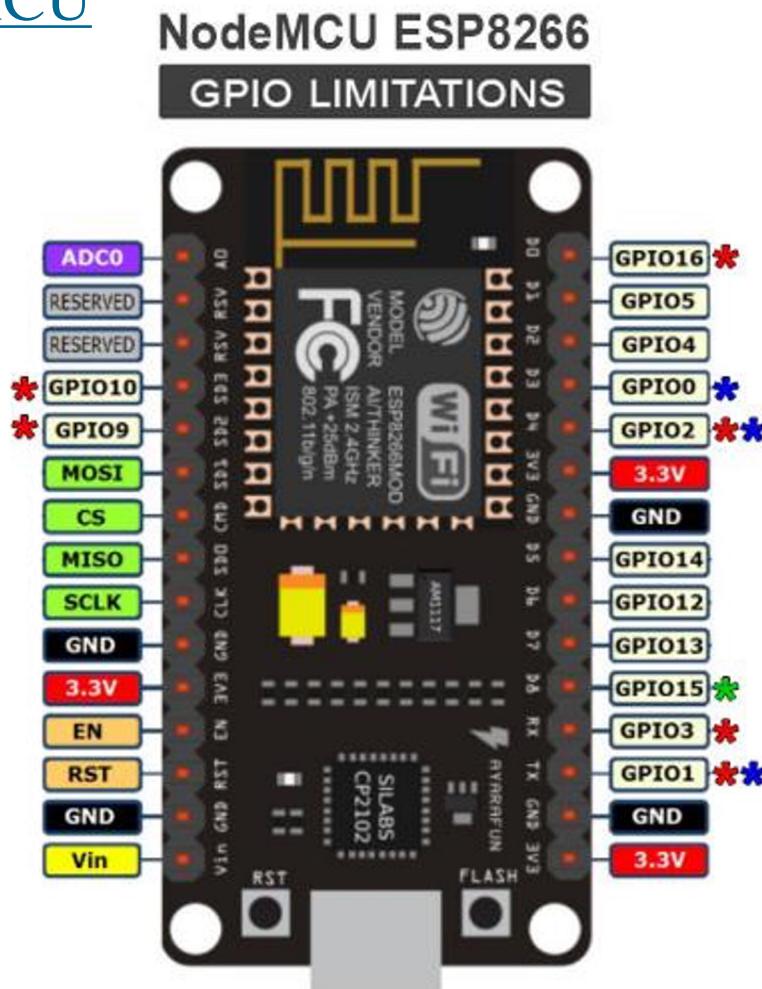

- One of the most useful tools in an engineer or Maker's toolkit.
- The three most important things:
 - A breadboard is easier than soldering
 - A lot of those little holes are connected, which ones?
 - Sometimes breadboards break

Wiring a LED with Arduino

Hardware

- NodeMCU

GPIO LIMITATIONS

- *Pin is high on boot
- *Boot failure if pulled low
- *Boot failure if pulled high

Best Pins for Input (best to worst)	
Board Label	Raw Pin Number
D1	5
D2	4
D5	14
D6	12
D7	13
D0	16
SD2	9
SD3	10
RX	3

Best Pins for Output (best to worst)	
Board Label	Raw Pin Number
D1	5
D2	4
D5	14
D6	12
D7	13
D8	15

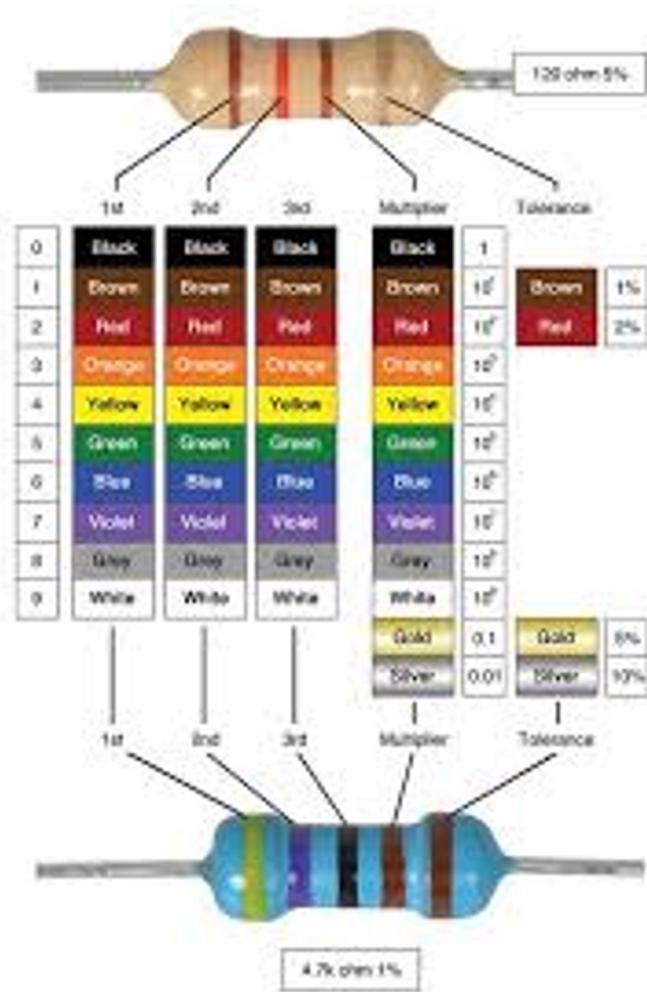

Made by: www.youtubee.com/c/TheHooKUp

The resistor

Resistors are the **workhorse** of electronics

Resistance is **measured** in Ω (Ohm) and adds up in series; a resistors orientation doesn't matter

A resistors Ω value is **color-coded** right on it

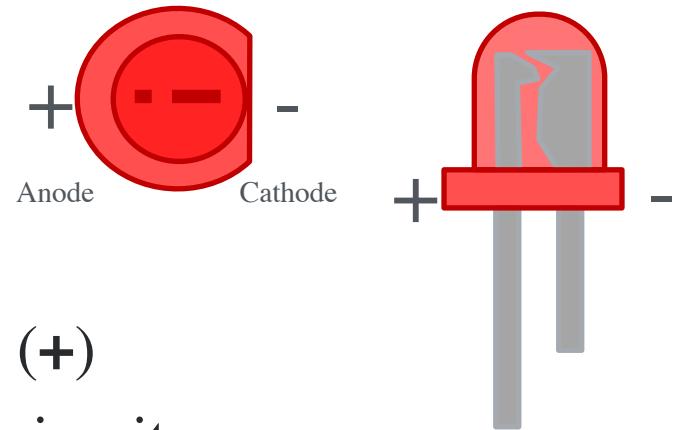

The LED

The **LED** (Light Emitting Diode)
is a simple, digital **actuator**

LEDs have a **short leg (-)** and a **long leg (+)**
and it matters how they are oriented in a circuit

To prevent damage, LEDs are used together with a $1K\Omega$
resistor (or anything from 300Ω to $2K\Omega$)

Hands-on Activity - I

NodeMCU

Wiring a LED with Arduino

We will introduce how to blink the on-board LED and how to blink a external LED.

Hardware

- NodeMCU x 1
- LED x 1
- 1K ohm resistor x 1
- Micro USB cable x 1
- PC x 1

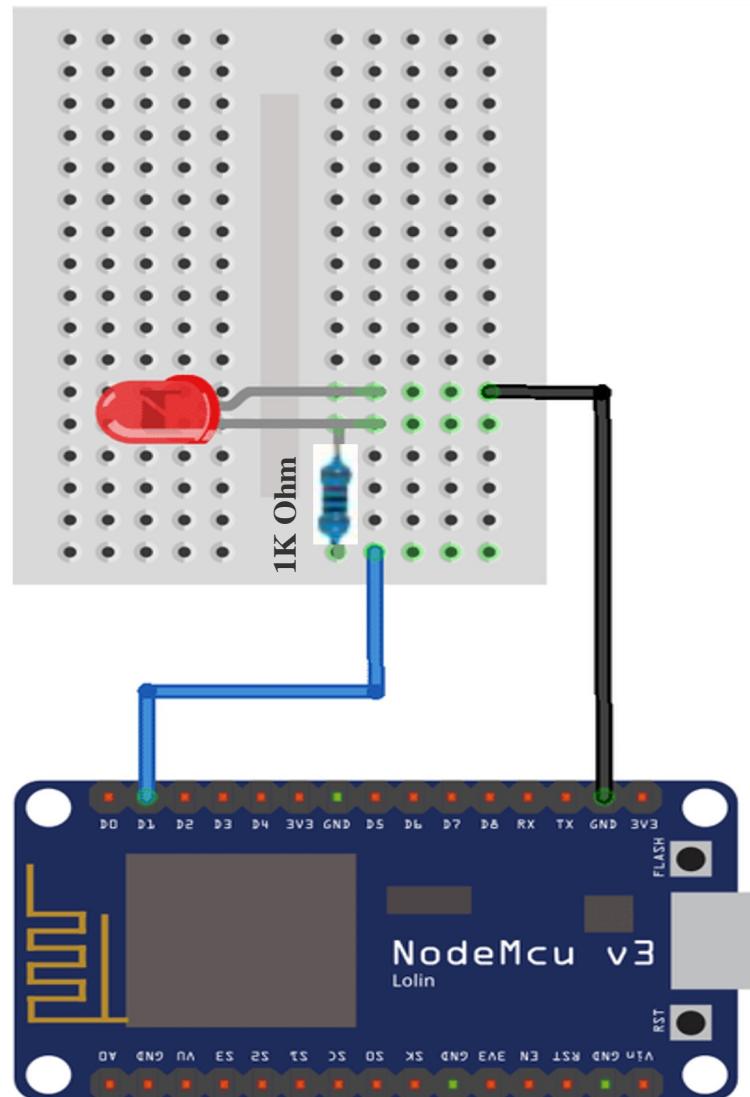

Software

- Arduino IDE(version 1.6.4+)
- [https://github.com/muratkuzlu/ODU_BLAST2021
/tree/main/Projects/1_LED_Blink](https://github.com/muratkuzlu/ODU_BLAST2021/tree/main/Projects/1_LED_Blink)

Wiring a LED with Arduino

Set up

- Connect the long leg of the LED (the positive leg, called the anode) to the other end of the resistor (1K ohm).
- Connect the short leg of the LED (the negative leg, called the cathode) to the GND.
- In the diagram below we show a NodeMCU that has D1 as the `LED_BUILTIN` value.

Digital output with Arduino

Code

→ Copy the following code to the IDE

```
#define LED D1 // Led in NodeMCU at pin GPIO5 (D1).
```

Specifying what pin is going to be used

```
void setup()
{
pinMode(LED, OUTPUT); // set the digital pin as output.
}
```

**Initialize variables.
Runs once**

```
void loop()
{
digitalWrite(LED, HIGH); // turn the LED off.
delay(1000); // wait for 1 second.
digitalWrite(LED, LOW); // turn the LED on.
delay(1000); // wait for 1 second.
}
```

Used to actively control the Arduino board. Run repeatedly

Note that LOW is the voltage level but actually the LED is on; this is because it is active low on the ESP8266.

→ Upload

Digital output with Arduino and IoT - I

Now we are going to connect to IoT

→ Copy the following code to a new IDE sketch

```
#include "ThingSpeak.h"
#include <ESP8266WiFi.h>

const char *ssid = "ssid"; // replace with your wifi ssid and wpa2 key
const char *pass = "password";
const char* server = "api.thingspeak.com";
// Enter your Write API key from ThingSpeak
const char * myWriteAPIKey = "3M0SBN71PI6UD1A4";
unsigned long myChannelNumber = 803487;
uint8_t LED_Status, l=0;

WiFiClient client;

#define LED D1 // Led in NodeMCU at pin GPIO5 (D1).
```

The screenshot shows two pages of the ThingSpeak web interface. The top page is titled 'Write API Key' and displays a key value '3M0SBN71PI6UD1A4' in a highlighted box with a 'Generate New Write API Key' button below it. The bottom page is titled 'Channel Settings' and lists a channel with ID 803487, name 'ODU_Blast2019', and description 'Hands-on IOT Activities'. It includes three fields: 'Field 1' (Temperature) checked, 'Field 2' (Humidity) checked, and 'Field 3' (LED_Status) checked.

Digital output with Arduino and IoT - II

```
void setup()
{
    Serial.begin(115200);
    delay(10);

    pinMode(LED, OUTPUT); // LED D1 pin as output.

    Serial.println("Connecting to ");
    Serial.println(ssid);
    WiFi.begin(ssid, pass);
    while (WiFi.status() != WL_CONNECTED)
    {
        delay(500);
        Serial.print(".");
    }
    Serial.println("");
    Serial.println("WiFi connected");
    // Print the IP address
    Serial.println(WiFi.localIP());
    ThingSpeak.begin(client);
}
```

Digital output with Arduino and IoT - III

```
void loop() {  
    LED_Status = HIGH;  
  
    digitalWrite(LED, LED_Status); // turn the LED off.(Note that LOW is the voltage level  
but actually  
        //the LED is on; this is because it is active low on the ESP8266.  
  
    Serial.print("LED Status is :");  
    Serial.print(LED_Status);  
  
    ThingSpeak.writeField(myChannelNumber, 3, LED_Status, myWriteAPIKey);  
    delay(30000); // ThingSpeak will only accept updates every 15 seconds.  
  
  
    LED_Status = LOW;  
    digitalWrite(LED, LED_Status); // turn the LED on.  
  
    Serial.print("LED Status is :");  
    Serial.print(LED_Status);  
  
    ThingSpeak.writeField(myChannelNumber, 3, LED_Status, myWriteAPIKey);  
    delay(30000); // ThingSpeak will only accept updates every 15 seconds. → Upload  
}
```

Changes in LED
ON & OFF every
second

Hands-on Activity - II

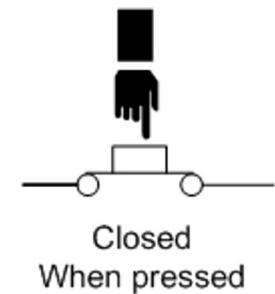

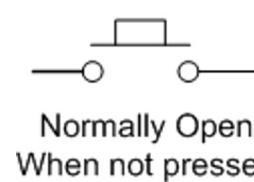

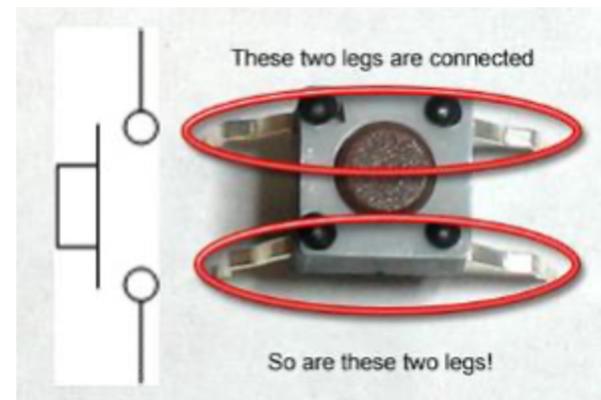

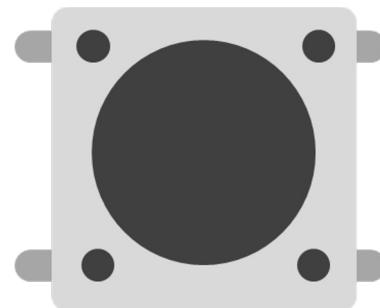

NodeMCU

The switch

A switch is a simple, digital **sensor**

Switches come in different forms, but all of them in some way **open** or **close** a gap in a wire

The **pushbutton** switch has four legs for easier mounting, but only two of them are needed

Wiring a switch with Arduino

We will introduce how to blink the on-board LED and how to blink a external LED.

Hardware

- NodeMCU x1
- Push Button x1
- LED x1
- 10 K ohm Resistor x1
- 200-ohm Resistor x1
- Bread Board x1
- PC x1

Software

- [Arduino IDE\(version 1.6.4+\)](#)
- [https://github.com/muratkuzlu/ODU_BLAST2021/
tree/main/Projects/2_Switch_LED](https://github.com/muratkuzlu/ODU_BLAST2021/tree/main/Projects/2_Switch_LED)

Digital input with Arduino

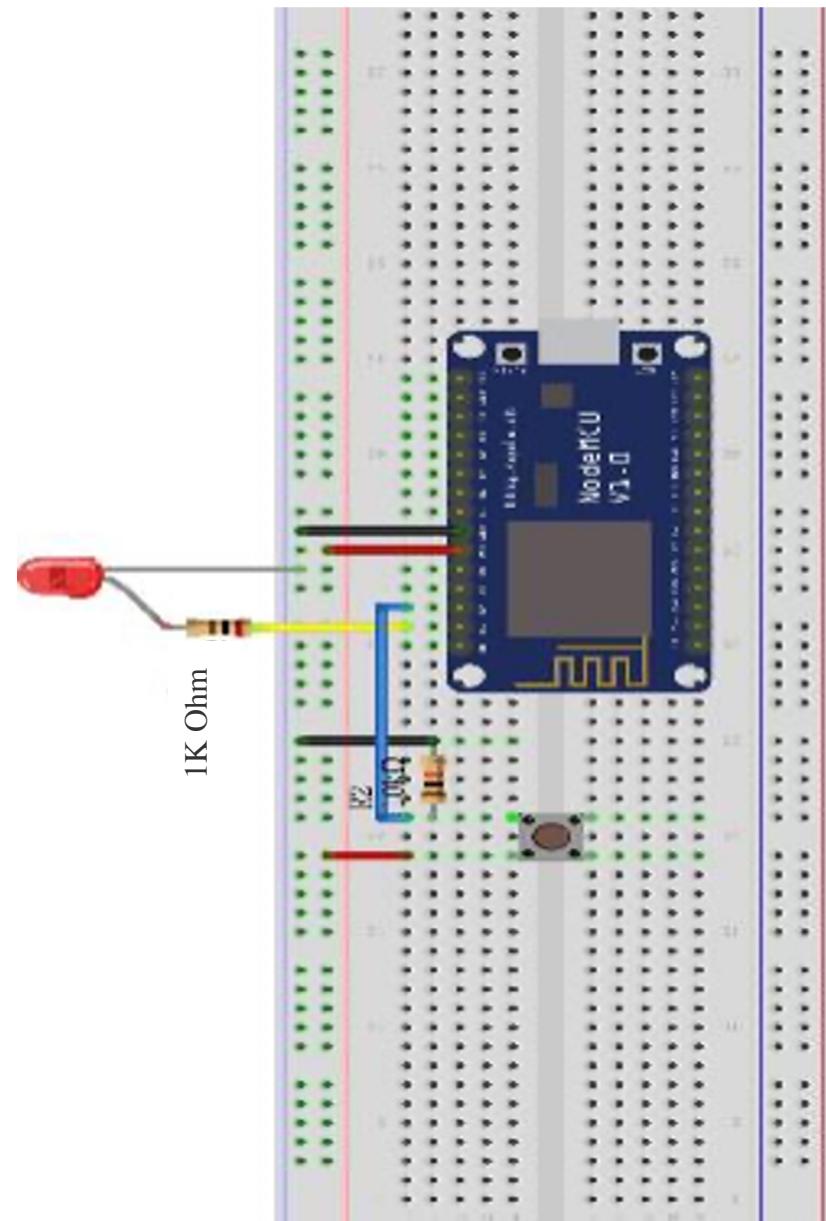

Set up

Push Button connections :

- The first pin goes from one leg of the pushbutton through a pull-up resistor(here 10K Ohms) to Ground (**GND**).
- The **second pin** goes from the corresponding leg of the pushbutton to the **5v supply pin**.
- The **third pin** connects to a Digital I/O pin (here pin **D2**) which reads the button's state.

LED connections:

- LED Anode is connected to Digital I/O pin (here pin **D1**) and Cathode to ground (**GND**) pin.

Digital input with Arduino

Code

- Copy the following code to the IDE

```
#define LED 5 // D1(gpio5)
#define BUTTON 4 //D2(gpio4)

int buttonState=0;
int switchState = 0; // actual read value from pin4
int oldSwitchState = 0; // last read value from pin4
int lightsOn = 0; // is the switch on = 1 or off = 0

void setup() {
pinMode(BUTTON, INPUT); // push button
pinMode(LED, OUTPUT); // anything you want to control using a switch e.g. a Led
}

void loop() {
switchState = digitalRead(BUTTON); // read the pushButton State
if (switchState != oldSwitchState) // catch change
{
oldSwitchState = switchState;
if (switchState == HIGH)
{
// toggle
lightsOn = !lightsOn;
}
}
if(lightsOn)
{
digitalWrite(LED, HIGH); // set the LED on
} else {
digitalWrite(LED, LOW); // set the LED off
}
}
```

→ Upload

Digital input with Arduino and IoT - I

Now we are going to connect to IoT

- Copy the following code to a new IDE sketch

```
#include "ThingSpeak.h"
#include <ESP8266WiFi.h>
const char *ssid = "AS2L-Room"; // replace with your wifi ssid and wpa2 key
const char *pass = "as2l214c";
const char* server = "api.thingspeak.com";
const char * myWriteAPIKey = "3M0SBN71PI6UD1A4"; // Enter your Write API key from
ThingSpeak

unsigned long myChannelNumber = 803487;

WiFiClient client;

#define LED 5 // D1(gpio5)
#define BUTTON 4 //D2(gpio4)

int buttonState=0;

int switchState = 0; // actual read value from pin4
int oldSwitchState = 0; // last read value from pin4
int lightsOn = 0; // is the switch on = 1 or off = 0
```

Digital input with Arduino and IoT - II

```
void setup()
{
    Serial.begin(115200);
    delay(10);

    pinMode(BUTTON, INPUT); // push button
    pinMode(LED, OUTPUT); // anything you want to control using a switch e.g. a Led

    Serial.println("Connecting to ");
    Serial.println(ssid);

    WiFi.begin(ssid, pass);

    while (WiFi.status() != WL_CONNECTED)
    {
        delay(500);
        Serial.print(".");
    }
    Serial.println("");
    Serial.println("WiFi connected");

    // Print the IP address
    Serial.println(WiFi.localIP());
    ThingSpeak.begin(client);
}
```

Digital input with Arduino and IoT - III

```
void loop() {
switchState = digitalRead(BUTTON); // read the pushButton State
if (switchState != oldSwitchState) // catch change
{
oldSwitchState = switchState;
if (switchState == HIGH)
{
// toggle
lightsOn = !lightsOn;
}
}
if(lightsOn)
{
digitalWrite(LED, HIGH); // set the LED on
buttonState = HIGH;
} else {
digitalWrite(LED, LOW); // set the LED off
buttonState = LOW;
}
Serial.print("Button Status is :");
Serial.print(buttonState);
ThingSpeak.writeField(myChannelNumber, 4, buttonState,
myWriteAPIKey);
delay(1000);
}
```

Changes in Button Status

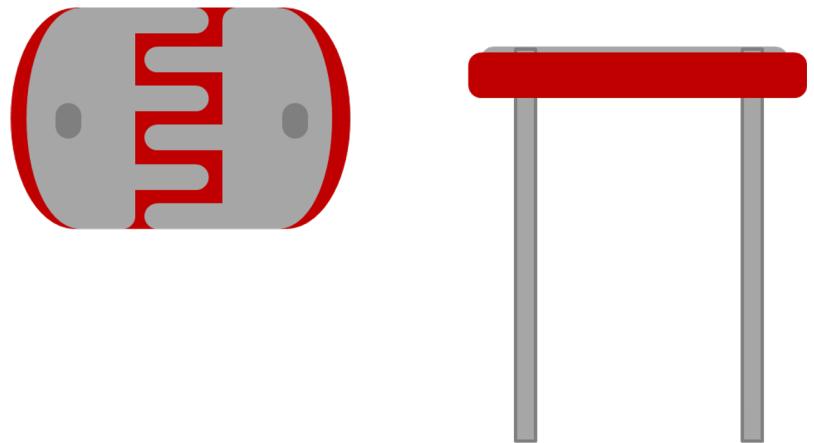

Hands-on Activity - III

NodeMCU

Photoresistor (LDR)

A photoresistor or **LDR** (light dependent resistor) is a resistor whose resistance depends on light intensity

An LDR can be used as a simple, **analog sensor**

The orientation of an LDR does not matter

Wiring a LED with Arduino

We will introduce how to blink the on-board LED and how to blink a external LED.

Hardware

- NodeMCU
- LDR / photoresistor
- 10k ohm resistor
- Breadboard
- Micro USB cable
- Connecting Wires

Software

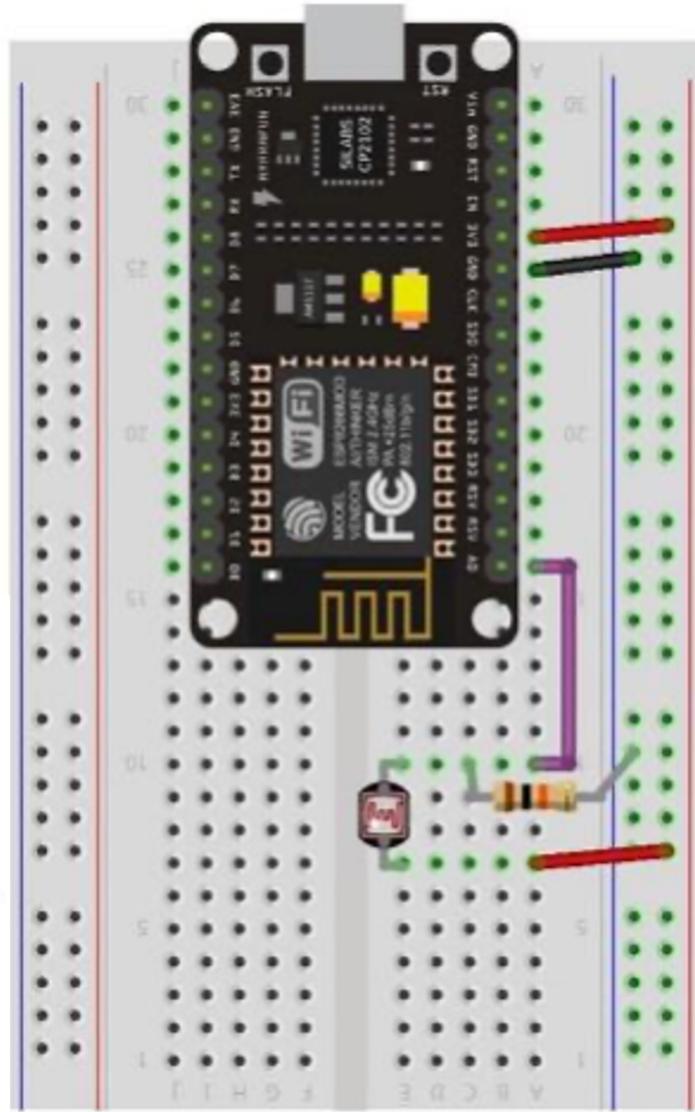

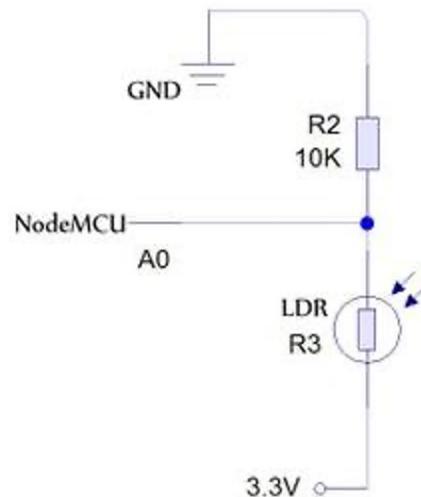

- [Arduino IDE\(version 1.6.4+\)](#)
- [https://github.com/muratkuzlu/ODU_BLAST2021
/tree/main/Projects/3_LDR_ADC](https://github.com/muratkuzlu/ODU_BLAST2021/tree/main/Projects/3_LDR_ADC)

Wiring a LED with Arduino

Set up

The LDR output is actually analog in nature, so it gets connected to the A0 pin of the NodeMCU.

Note: this setup is a *voltage-divider*, as the total voltage is divided between LDR and resistor to keep $0V < A0 < 2.5V$

Analog input with Arduino

Code

→ Copy the following code to the IDE

```
void setup()
{
    Serial.begin(115200);
    delay(10);
}

void loop() {
    int sensorValue = analogRead(A0); // read the input on analog pin 0

    float voltage = sensorValue * (5.0 / 1023.0); // Convert the analog
    reading (which goes from 0 - 1023) to a voltage (0 - 5V)

    Serial.println(voltage); // print out the value you read
}
```

→ Upload

Analog input with Arduino and IoT - I

Now we are going to connect to IoT

- Copy the following code to a new IDE sketch

```
#include "ThingSpeak.h"  
#include <ESP8266WiFi.h>  
  
const char *ssid = "AS2L-Room"; // replace with your wifi ssid and wpa2 key  
const char *pass = "as2l214c";  
const char* server = "api.thingspeak.com";  
const char * myWriteAPIKey = "3M0SBN71PI6UD1A4"; // Enter your Write API key from ThingSpeak  
  
unsigned long myChannelNumber = 803487;  
  
WiFiClient client;
```

Analog input with Arduino and IoT - II

```
void setup()
{
    Serial.begin(115200);
    delay(10);

    Serial.println("Connecting to ");
    Serial.println(ssid);
    WiFi.begin(ssid, pass);
    while (WiFi.status() != WL_CONNECTED)
    {
        delay(500);
        Serial.print(".");
    }
    Serial.println("");
    Serial.println("WiFi connected");

    // Print the IP address
    Serial.println(WiFi.localIP());
    ThingSpeak.begin(client);
}
```

Analog input with Arduino and IoT - III

```
void loop() {  
  
    int sensorValue = analogRead(A0); // read the input on analog pin 0  
  
    float voltage = sensorValue * (5.0 / 1023.0); // Convert the analog reading (which goes from  
0 - 1023) to a voltage (0 - 5V)  
  
    Serial.println(voltage); // print out the value you read  
    Serial.print("Photoresistor value is :");  
    Serial.print(voltage);  
    ThingSpeak.writeField(myChannelNumber, 5, voltage, myWriteAPIKey);  
    delay(30000); // ThingSpeak will only accept updates every 15 seconds.  
}
```

Changes in
Photoresistor

ThingSpeak.com

Hands-on Activity - IV

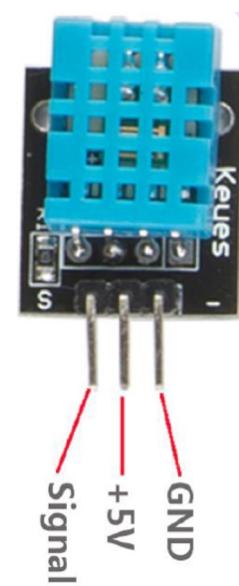

NodeMCU

Temperature & Humidity Sensor DHT11

The DHT11 sensor can detect temperature (C and F) & humidity.

The DHT11 detects water vapor by measuring the electrical resistance between two electrodes. The humidity sensing component is a moisture holding substrate with electrodes applied to the surface.

It has everything it requires built into it, so it will work very well with the NodeMCU. This sensor is used in conjunction with the DHT11 Library.

Wiring a switch with Arduino

We will learn how to set up the DHT11 Humidity and Temperature sensor on your NodeMCU. And learn about how the Humidity sensor works, and how to check output readings from the Serial monitor.

Hardware

- NodeMCU
- DHT11 Humidity and Temperature sensor
- Breadboard
- Jumper Wires (Optional)
- Micro USB Cable

Software

- [Arduino IDE\(version 1.6.4+\)](#)
- [https://github.com/muratkuzlu/ODU_BLAST2021/
tree/main/Projects/4_DHT11](https://github.com/muratkuzlu/ODU_BLAST2021/tree/main/Projects/4_DHT11)

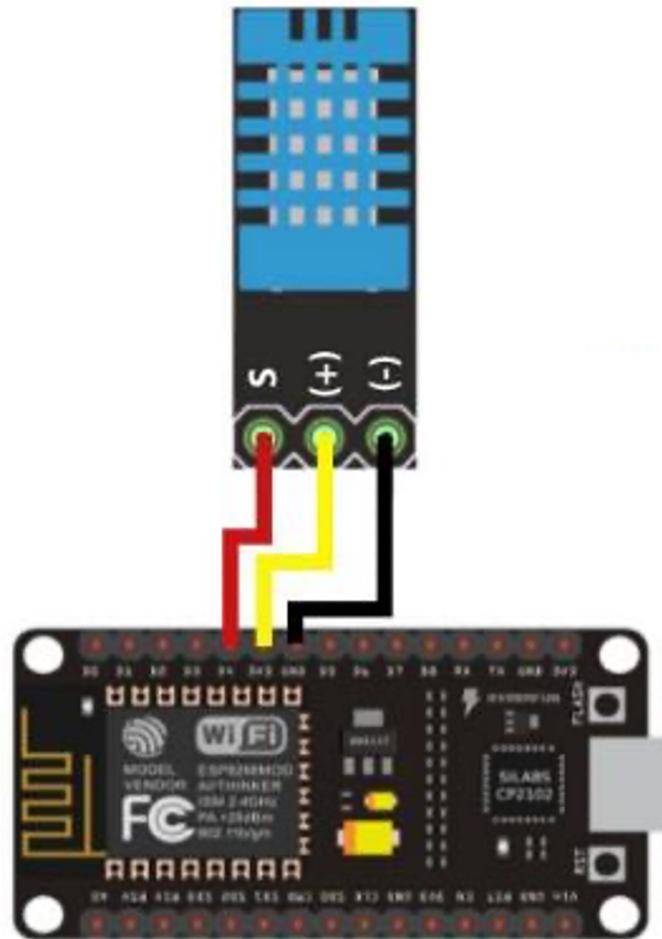

Digital input with Arduino

Set up

Wiring the **DHT11** to the NodeMCU is really easy, but the connections are different depending on which type you have either 3-pins or 4-pins

The **wiring connections** are made as follows:

- **Pin 1** of the DHT11 goes into Digital Pin **D4** of the NodeMCU.
- **Pin 2** of the DHT11 goes into **+3.3v** of the NodeMCU.
- **Pin 3** of the DHT11 goes into Ground Pin (**GND**) of the NodeMCU.

Digital input with Arduino

Code

→ Copy the following code to the IDE

Add the DHTesp.h library

Define Variables

Initialize variables.
Runs once

Used to actively control
the Arduino board. Run
repeatedly

```
#include "DHTesp.h"  
  
int temperature, humidity, k=0, l=0;  
  
#define DHTPIN D4      //pin where the dht11 is connected  
DHTesp dht;  
  
void setup()  
{  
    Serial.begin(115200);  
    delay(10);  
    //dht.begin();  
    dht.setup(DHTPIN, DHTesp::DHT11); // data pin 4  
}  
  
void loop()  
{  
    static boolean data_state = false;  
    float humidity = dht.getHumidity();  
    float temperature = dht.getTemperature();  
    temperature = CelsiusToFahrenheit(temperature);  
    Serial.print("Temperature Value is :");  
    Serial.print(temperature);  
    Serial.println("F");  
    Serial.print("Humidity Value is :");  
    Serial.print(humidity);  
    Serial.println("%");  
    delay(5000);  
}
```

//Functions

```
float FahrenheitToCelsius(float fahrenheit)
{
    float celsius;
    celsius = (fahrenheit - 32.0) * 5.0 / 9.0;
    return celsius;
}
```

```
float CelsiusToFahrenheit(float celsius)
{
    float fahrenheit;
    fahrenheit = (celsius * 9.0) / 5.0 + 32;
    return fahrenheit;
}
```

NOTE:

When you check the serial monitor make sure the baud rate and the serial begin number in your code is the same.

→ Upload

Digital input with Arduino and IoT - I

Now we are going to connect to IoT

→ Copy the following code to a new IDE sketch

```
#include "DHTesp.h"
#include "ThingSpeak.h"
#include <ESP8266WiFi.h>

const char *ssid = "AS2L-Room"; // replace with your wifi ssid and wpa2 key

Humidity

Hands-on Activity - V

NodeMCU

Interfacing a 4x4 Keypad with Arduino

We will introduce how to use a 4x4 matrix keypad with the NodeMCU ESP8266. We will then monitor the inputs of the keypad through IoT by using ThingSpeak.

Hardware

- NodeMCU x 1
- Breadboard x 1
- Micro USB cable x 1
- PC x 1
- Membrane Switch Module Keypad
- Male to Male Wires x 8

Software

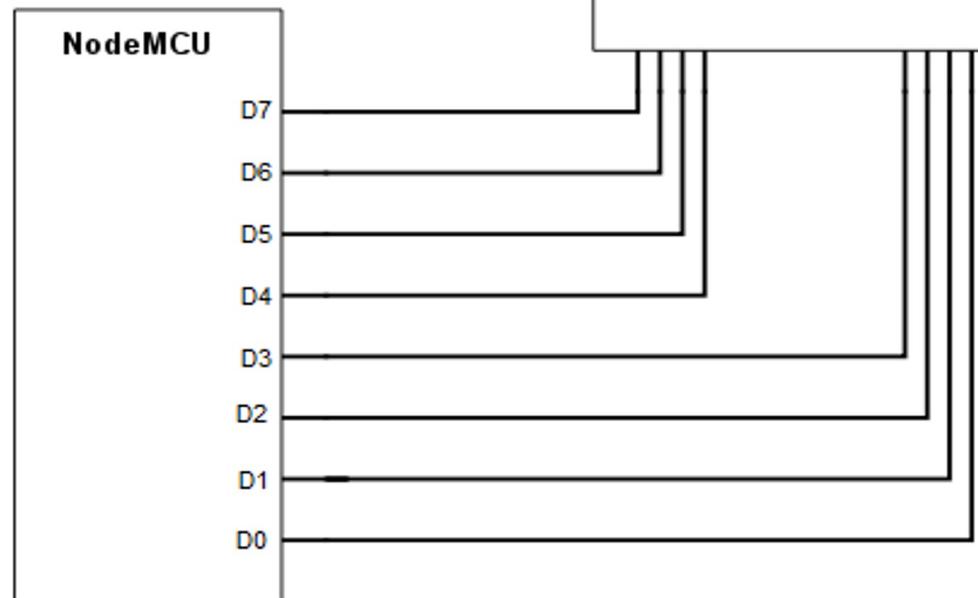

- Arduino IDE(version 1.6.4+)
- [https://github.com/muratkuzlu/ODU_BLAST2021
/tree/main/Projects/5_Keypad](https://github.com/muratkuzlu/ODU_BLAST2021/tree/main/Projects/5_Keypad)

Wiring a 4x4 Keypad with Arduino

Set up

- With the screen of Membrane Switch Module facing you, start from left to right when wiring each of the eight male to male wires
- The first wire connects to pin (D7)
- The second wire connects to pin (D6)
- The third wire connects to pin (D5)
- The fourth wire connects to pin (D4)
- The fifth wire connects to pin (D3)
- The sixth wire connects to pin (D2)
- The seventh wire connects to pin (D1)
- The eighth wire connects to pin (D0)

4x4 Matrix Keypad			
1	2	3	A
4	5	6	B
7	8	8	C
*	0	#	D

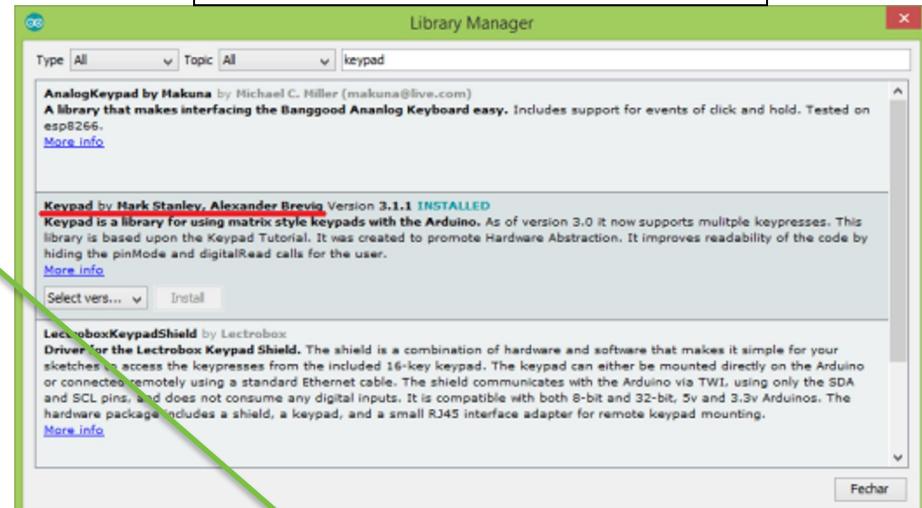

Digital output with Arduino - I

Code

```
#include <Keypad.h> ←  
  
const byte n_rows = 4;  
const byte n_cols = 4;  
  
char keys[n_rows][n_cols] = [  
    {'1', '2', '3', 'A'},  
    {'4', '5', '6', 'B'},  
    {'7', '8', '9', 'C'},  
    {'*', '0', '#', 'D'}  
};  
  
byte colPins[n_rows] = {D3, D2, D1, D0};  
byte rowPins[n_cols] = {D7, D6, D5, D4};  
  
Array Declaration
```

Add the keypad.h library

Global
Variables

Keypad Mappings

Digital output with Arduino - II

```
Keypad myKeypad = Keypad( makeKeymap(keys), rowPins, colPins, n_rows, n_cols);  
  
void setup(){  
    Serial.begin(115200);  
}  
  
void loop(){  
    char myKey = myKeypad.getKey();  
  
    if (myKey != NULL){  
        Serial.print("Key pressed: ");  
        Serial.println(myKey);  
    }  
}
```

Passing the matrix of keys to a macro that will cast it to a char array

Initialize the Serial Connection

Obtain the key that is being pressed

Digital output with Arduino and IoT - I

```
#include "ThingSpeak.h"
#include <ESP8266WiFi.h>
#include <Keypad.h>

const char *ssid = "AS2L-Room";      // replace with your wifi ssid
const char *pass = "as2l214c";        // replace with your wifi password

const char* server = "api.thingspeak.com";
const char * myWriteAPIKey = "3M0SBN71PI6UD1A4";           ←
// Enter your Write API key from ThingSpeak
unsigned long myChannelNumber = 803487;

WiFiClient client;

const byte n_rows = 4;
const byte n_cols = 4;

char keys[n_rows][n_cols] = {
    {'1','2','3','A'},
    {'4','5','6','B'},
    {'7','8','9','C'},
    {'*','0','#','D'}
};

byte colPins[n_rows] = {D3, D2, D1, D0};
byte rowPins[n_cols] = {D7, D6, D5, D4};
```

Now we are going to connect to IoT

The screenshot shows two ThingSpeak pages side-by-side.

Top Page: API Keys Settings. It displays a "Write API Key" section with a text input field containing "3M0SBN71PI6UD1A4". Below it is a "Generate New Write API Key" button. The top navigation bar includes "Private View", "Public View", "Channel Settings", "Sharing", "API Keys" (which is the active tab), and "Data Import / Export". A "Help" section on the right provides information about API keys.

Bottom Page: Channel Settings. It shows details for Channel ID 803487, which is named "ODU_Blast2019" and has a description "Hands-on IOT Activities". It lists three fields: "Field 1" (Temperature) with a checked checkbox, "Field 2" (Humidity) with a checked checkbox, and "Field 3" (LED_Status) with a checked checkbox. The top navigation bar for this page includes "Private View", "Public View", "Channel Settings", and "Sharing".

Digital output with Arduino and IoT - II

```
Keypad myKeypad = Keypad( makeKeymap(keys), rowPins, colPins, n_rows, n_cols);

void setup()
{
    Serial.begin(115200);
    delay(10);

    Serial.println("Connecting to ");
    Serial.println(ssid);

    WiFi.begin(ssid, pass);

    while (WiFi.status() != WL_CONNECTED)
    {
        delay(500);
        Serial.print(".");
    }
    Serial.println("");
    Serial.println("WiFi connected");

    // Print the IP address
    Serial.println(WiFi.localIP());
    ThingSpeak.begin(client);

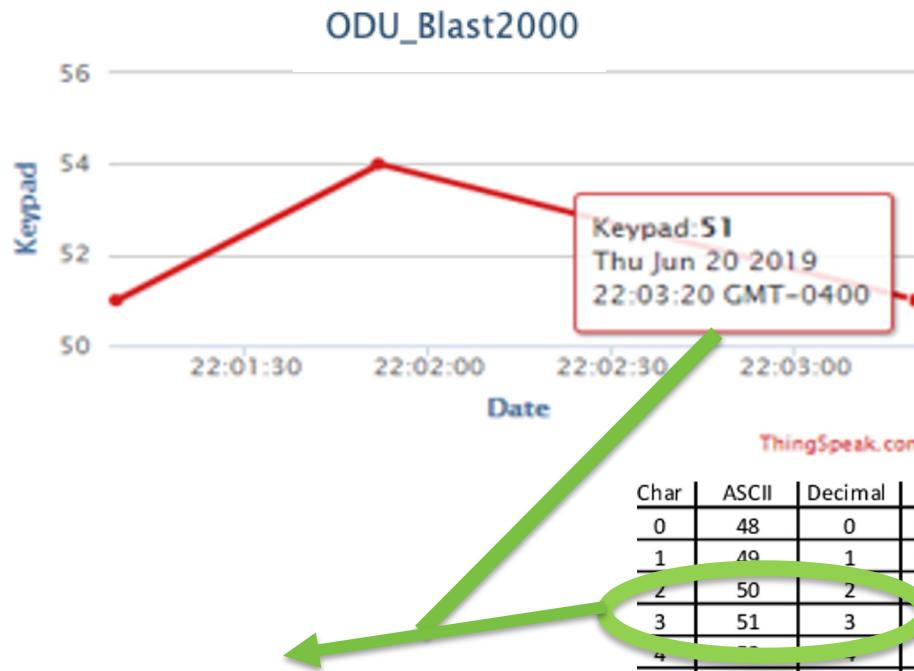

}
```

Digital output with Arduino and IoT - III

```
void loop() {  
    char myKey = myKeypad.getKey();  
  
    if (myKey != NULL) {  
        Serial.print("Key pressed: ");  
        Serial.println(myKey);  
        ThingSpeak.writeField(myChannelNumber, 6, myKey, myWriteAPIKey);  
        delay(3000); // ThingSpeak will only accept updates every 15 seconds.  
    }  
}
```

→ Upload

Digital output with Arduino and IoT -IV

- The number three was pressed on the keypad and the last entry recorded on ThingSpeak was 51. If you refer to the ASCII table shown to the right, the number 51 represents the decimal number 3.

Hands-on Activity - I

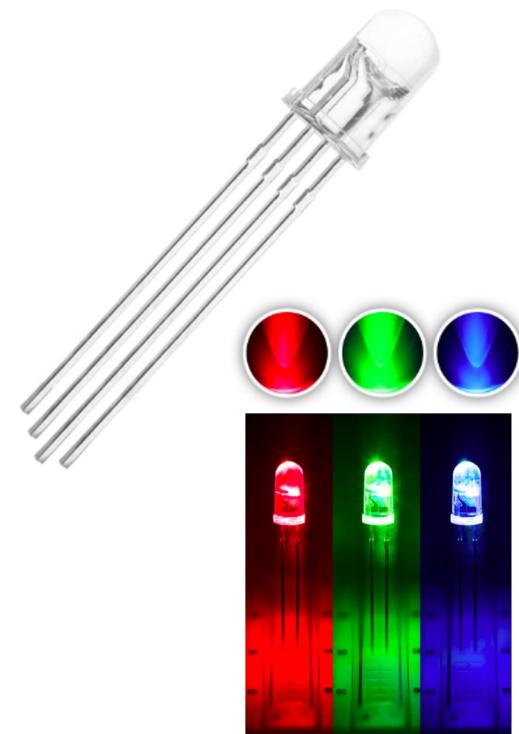

MEGA2560

Wiring a RGB LED with Arduino

We will introduce how to use a RGB LED with the MEGA2560

Hardware

- (1) x Elegoo Mega 2560 R3
- (1) x 830 Tie Points Breadboard
- (4) x M-M wires (Male to Male jumperwires)
- (1) x RGB LED
- (3) x 220-ohm resistors

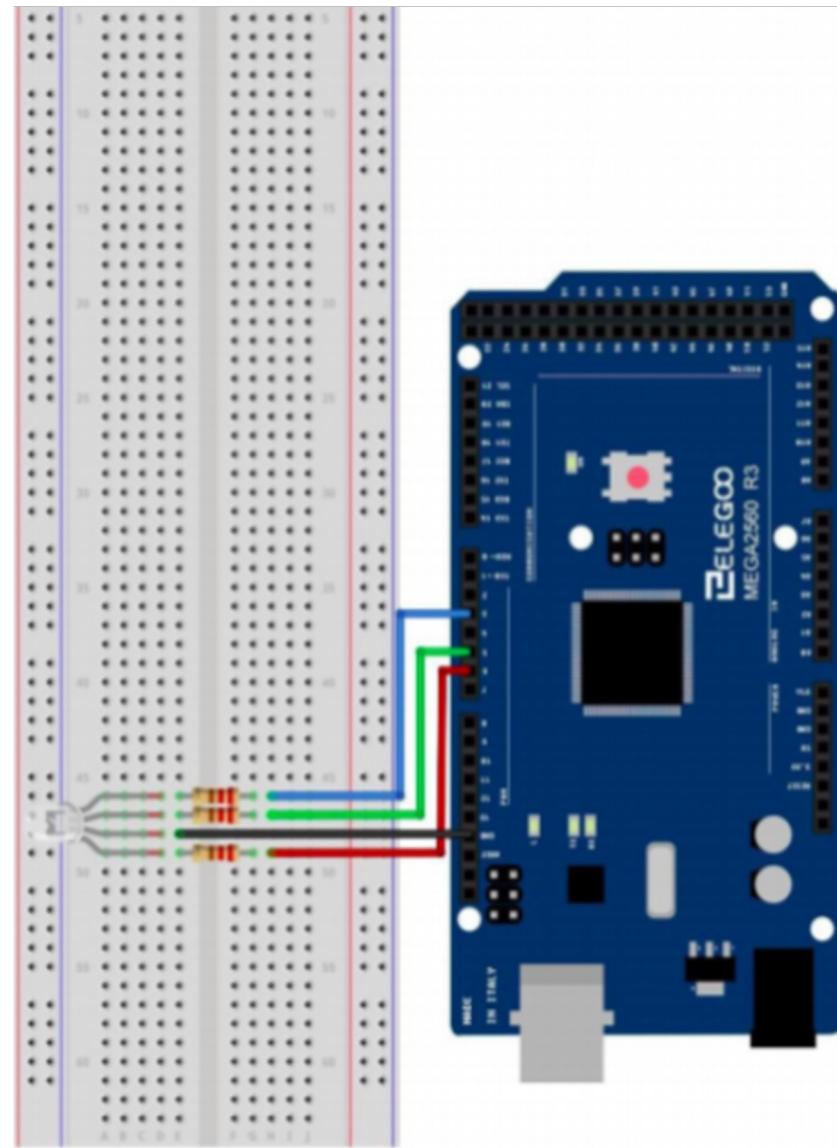

Software

- Arduino IDE(version 1.6.4+)

Wiring a RGB LED with Arduino

Set up

- Connect the longest lead(common cathode) of the RGB to ground.
- Connect each of the other three leads to a 220Ω resistor
- These three positive leads of the LEDs (one red, one green and one blue) are connected to MEGA 2560 output pins using these resistors.

Digital output with Arduino

Code

→ Copy the following code to the IDE

```
// Define Pins  
#define BLUE 3  
#define GREEN 5  
#define RED 6  
  
void setup()  
{  
pinMode(RED, OUTPUT);  
pinMode(GREEN, OUTPUT);  
pinMode(BLUE, OUTPUT);  
digitalWrite(RED, HIGH);  
digitalWrite(GREEN, LOW);  
digitalWrite(BLUE, LOW);  
}  
  
// define variables  
int redValue;  
int greenValue;  
int blueValue;
```

Digital output with Arduino

```
// main loop
void loop()
{
#define delayTime 20 // fading time between colors

redValue = 255; // choose a value between 1 and 255 to change
the color.
greenValue = 0;
blueValue = 0;

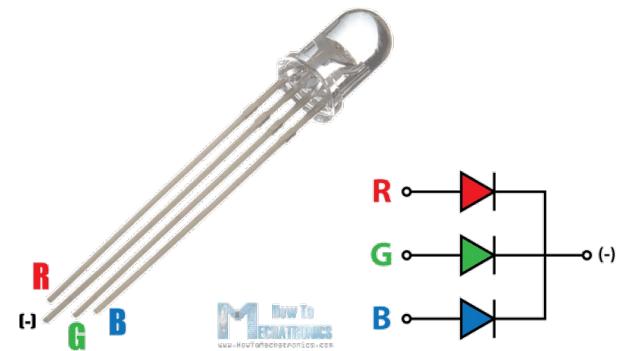

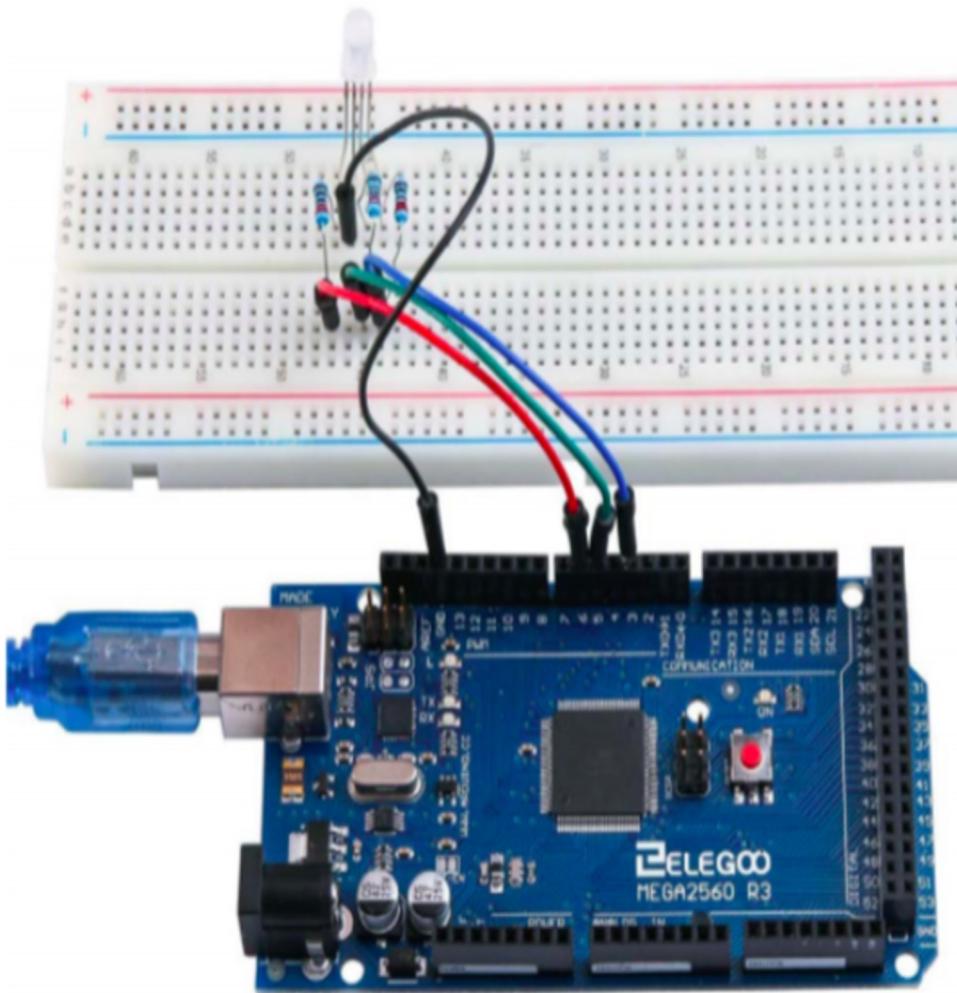

for(int i = 0; i < 255; i += 1) // fades out red bring green full when
i=255
{
redValue -= 1;
greenValue += 1;
// The following was reversed, counting in the wrong directions
// analogWrite(RED, 255 - redValue);
// analogWrite(GREEN, 255 - greenValue);
analogWrite(RED, redValue);
analogWrite(GREEN, greenValue);
delay(delayTime);
}
```

Digital output with Arduino

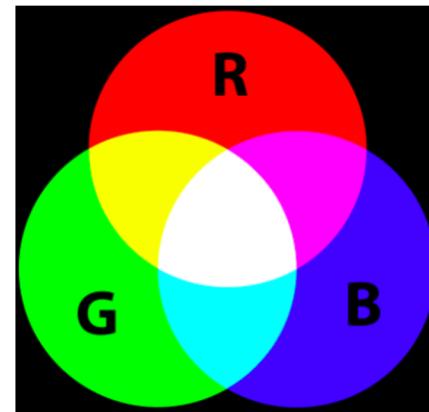

```
redValue = 0;  
greenValue = 255;  
blueValue = 0;  
  
for(int i = 0; i < 255; i += 1) // fades out green bring blue full when i=255  
{  
    greenValue -= 1;  
    blueValue += 1;  
    analogWrite(GREEN, greenValue);  
    analogWrite(BLUE, blueValue);  
    delay(delayTime);  
}  
  
redValue = 0;  
greenValue = 0;  
blueValue = 255;  
}  
for(int i = 0; i < 255; i += 1) // fades out blue bring red full when i=255  
{  
  
    blueValue -= 1;  
    redValue += 1;  
  
    analogWrite(BLUE, blueValue);  
    analogWrite(RED, redValue);  
    delay(delayTime);  
}
```

Digital output with Arduino

The RGB LED they are like three regular LEDs in one; Red, Green, Blue.

Combines these colors to produce the orders

Hands-on Activity - II

MEGA2560

Wiring a Buzzer with Arduino

We will introduce how to use a Passive Buzzer with the MEGA2560. You will generate eight different sounds, from Alto Do, Re, Mi, Fa, So, La, Si, to Treble Do.

Hardware

- (1) x Elegoo Mega 2560 R3
- (1) x Passive buzzer
- (2) x F-M wires (Female to Male DuPont wires)

Software

- [Arduino IDE\(version 1.6.4+\)](#)

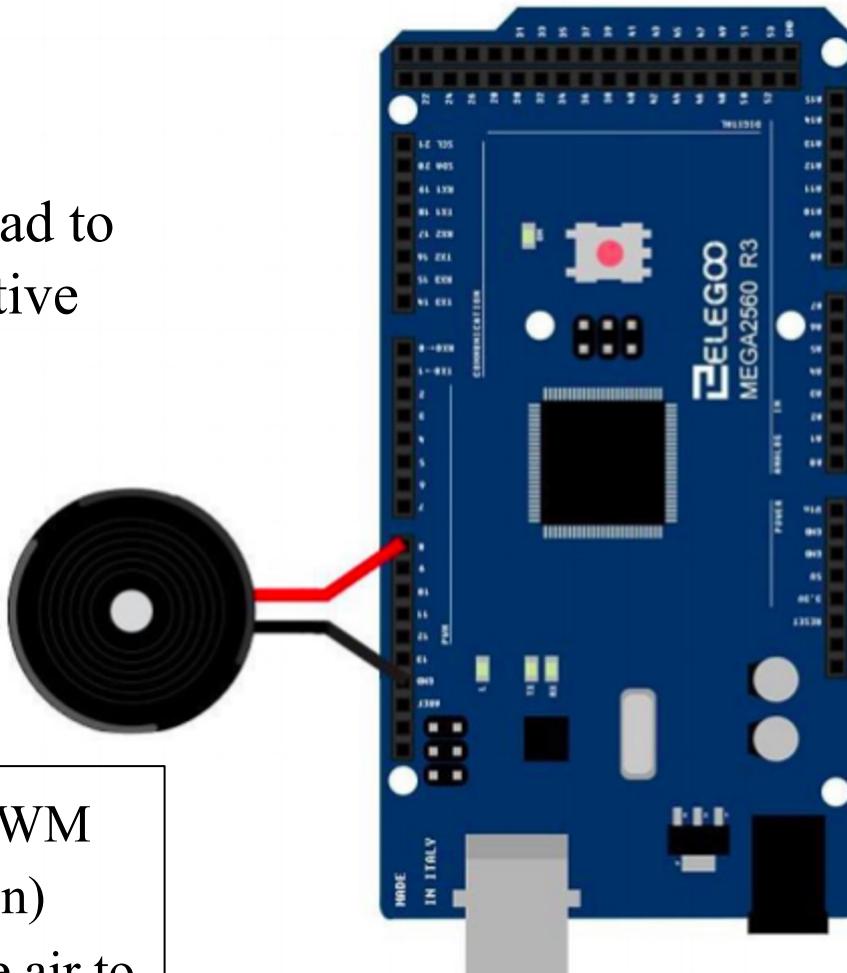

Wiring a RGB LED with Arduino

Set up

- Connect the positive lead to the pin 8, and the negative lead to the GND.

That's it!

The passive buzzer uses PWM (Pulse-Width Modulation) generating audio to make the air to vibrate. It works through pulses

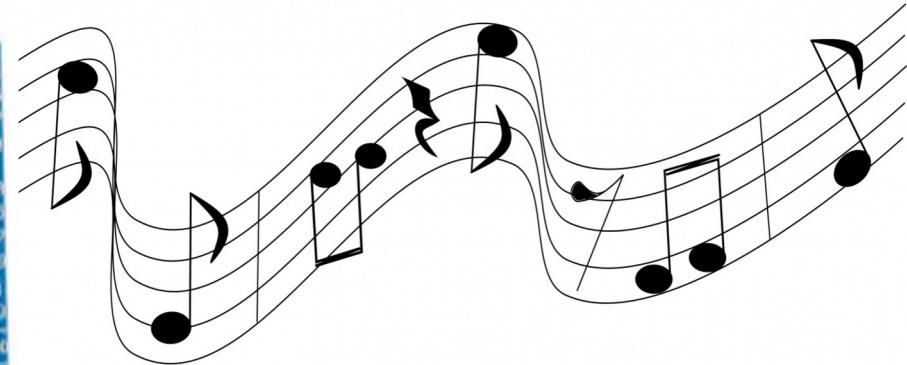

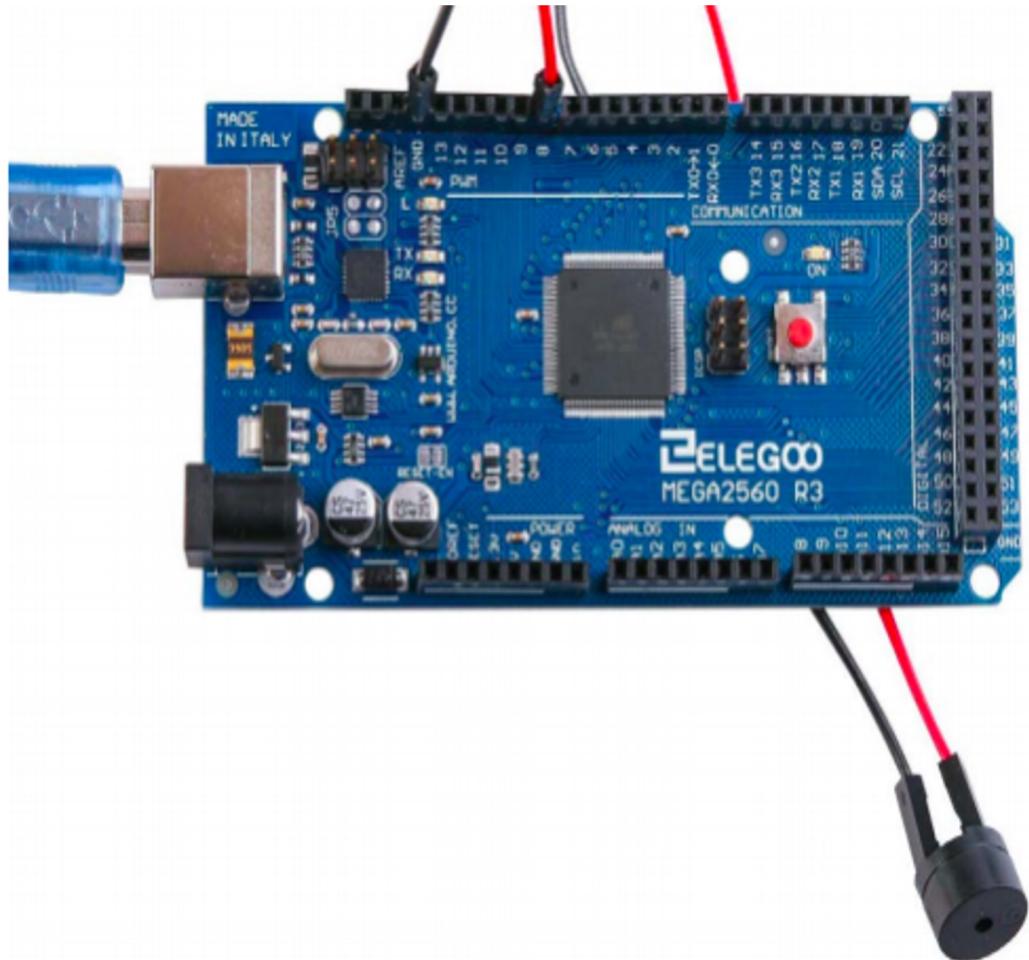

Digital output with Arduino

Code

→ Copy the following code to the IDE

```
#include "pitches.h"  
  
// notes in the melody:  
int melody[] = {  
    NOTE_C5, NOTE_D5, NOTE_E5, NOTE_F5,  
    NOTE_G5, NOTE_A5, NOTE_B5, NOTE_C6};  
int duration = 500; // 500 miliseconds  
void setup() {  
}  
void loop() {  
    for (int thisNote = 0; thisNote < 8; thisNote++) {  
        // pin8 output the voice, every scale is 0.5 sencond  
        tone(8, melody[thisNote], duration);  
        delay(500);  
    }  
    // restart after two seconds  
    delay(2000);  
}
```

Include Library
Pitches.h

Frequency of vibrations
change sound/note

Example:

Alto Do (523Hz), Re (587Hz), Mi (659Hz), Fa (698Hz).....
